And in accordance with law, and an order of the Board of Trustees, made on the 17th day of October, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Secretary, No. 305 Montgomery street, San Francisco, Cal., on Monday, the 16th day of December, 1872, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. B. CONGDON, Secretary

Office, 305 Montgomery street, San Francisco, Cal.

The North San Francisco Homestead and Railroad Association. Location of property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of Nov., 1872, an assessment of Three Dollars per share, was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 314 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid, on the sixth day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. D. SMITH, Secretary.

Office, 314 California street, San Francisco, Cal.

U. S. Grant Mining Company---Location of works, Carlisle, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of November, 1872, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, 226 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 30th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 20th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ENOS TAYLOR, Secretary.

Office, 226 Clay street, San Francisco, Cal. no23

NOTICE.

To the Stockholders of the Sutro Tunnel Company.

At a meeting of the Trustees of the Sutro Tunnel Company, held at the office of the Company, in the city of San Francisco, on the 12th day of November, 1872, the following resolution was adopted:

"Resolved, That it is the opinion of this Board that the capital stock of this Company should be increased up to Fifteen Million Dollars, and be divided into fifteen hundred thousand shares of the par value of ten dollars per share, and that a meeting of the stockholders be and is hereby called to take place at the office of the Company, in the city of San Francisco, at No. 321 California street, at 1 o'clock P. M. the Fourteenth day of December, 1872, to determine upon this proposition."

(Signed)

BAIRD'S
BOOKS
FOR PRACTICAL MEN.

My new revised and enlarged Catalogue of PRACTICAL AND SCIENTIFIC BOOKS, 96 pages, 8vo., will be sent, free of postage, to any one who will favor me with his address.

HENRY CAREY BAIRD,
Industrial Publisher, 405 Walnut St.,
22v25-5m PHILADELPHIA.

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Marsh Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries, No. 521 Montgomery St., between Clay and Commercial, San Francisco. n028

TOYS.

The Dewey Toy Engine—Patent Secured.

NOVELTY COMBINED WITH AMUSEMENT AND INSTRUCTION. Most Ingenious Toy of the Nineteenth Century. A Genuine Steam Working Engine, a Model of its Style, Complete and Perfect in all its Parts. Adapted to the wants of the Student, School-Room, and Parlor. This is not a humbug, but is a genuine Steam Engine, with Boiler, Cylinder, Piston, Fly-wheel, Safety and Throttle Valve, and a Grooved Pulley for imparting motion to other Toys. This Engine is design... something more than temporary amusement, as it will afford the means of amusement for the old as well as the young, and prove to be a source of pleasure and profit to all. EXPLOSION IMPOSSIBLE. Send for descriptive circular. WIESTER & CO., 17 New Montgomery street, San Francisco.

SOMETHING NEW.

We have for sale the Right to the Pacific Coast for a new and useful invention that is needed in every family. It is easily manufactured and requires but a small amount of capital to commence with. A number of orders have already been taken, which will be turned over to any party who may purchase the patent.

Samples can be seen at our office, or descriptive circulars will be sent to any address on application.

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

H & L AXLE GREASE.

The attention of Teamsters, Contractors and is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

3v24-eowr

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper

Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

DEWEY & Co.,
Publishers, Patent Agents and Engravers, No. 338 Montgomery street, S. E. corner California, S. F.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Address all orders (wholesale or retail) to

DEWEY & CO.,
Montgomery street, San Francisco.

Opinions of the Press.

* * * The work is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—S. F. Daily Examiner.

* * * All the sections of mineralogy, exploration, assaying, mining and metallurgy are teeming with appropriate originality, and contain vast quantities of useful information not found elsewhere, whilst the writer has shown an intimate knowledge of all the subjects treated, and has fully sustained the title, by supplying a most efficient *companion* to the miner and metallurgist.—[California Daily Republican.

* * * It is the best single English treatise we know of for the use of prospectors and practical miners. * * —[The Engineering and Mining Journal.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

MILL STONES.

Portable Mills, Eureka Smut Machines Bran Dusters, Dufour & Co.'s Celebrated Dutch Anchor Bolting Cloths, and General Mill Furnishing.

TRAVIS & WAGNER,
18v24-3m 41 First street, San Francisco.

OCCIDENTAL FOUNDRY,

137 and 139 First st., near the Gas Works, San Francisco.

STEIGER & BOLAND,

IRON FOUNDERS.

IRON CASTINGS of all descriptions at short notice

All orders punctually executed in time agreed on

Particular attention paid to making superior Shoes and Dies. Among the special castings of this Foundry are the well known CALLAHAN GRATE BAR, of superior merit for burning screenings—all size Bars. STRATTON'S JACK SCREWS, all sizes. Superior, compact and effective Horse Powers, Pumps, Agricultural Castings, Ingot Moulds, Assaying and Refining Retorts and Kettles, and a great variety of other and special castings.

STEIGER & BOLAND Proprietors.

Steiger & Boland are the sole Manufacturers of the Improved Hepburn Roller Pan. The patterns having all the improvements to those Pans, are at the Occidental Foundry, enabling the Establishment to deliver all pans and parts thereof with uniformity, finished in the best style, and at the lowest possible price. Pan Castings furnished the trade, with liberal facilities for erection, &c. All persons are cautioned against making, selling or using these Pans, except through the authorized agents and manufacturers, viz., Steiger & Boland, of the Occidental Foundry, S. F.

BUILDERS AND ARCHITECTS.

Brooklyn Freestone Quarries,

Three miles from the Brooklyn R. R. Depot and Landing, and 4½ miles from Oakland City Hall.

Having just completed a good road to these quarries, we are prepared to furnish large or small orders for either dimension stone, or roble stone, in San Francisco, Oakland, or Brooklyn, at such prices as cannot be competed with, for equal quality of stone; for base and elevation walls, for public and private buildings, monuments, fence walls, coping, window caps and sills, doorway trimmings and steps, stepping stones, curbing for streets and sidewalks, pavements or streets and street-crossings, bases for gravestones and plain and ornamental work for cemeteries, etc.

We can furnish cellar and basement walls of roble stone of superior quality in San Francisco at about the cost of brick work for the same.

The gray freestone from these quarries is considered far superior to that of any other within practical distance of San Francisco. It is readily worked and imperishable.

For samples we refer to the first story of the City Hall, Oakland, erected four years since, and the window caps and sills, and other finished work in the Deaf and Dumb Asylum, Oakland; in the Oakland Cemetery around the lot of J. S. Emory. Also small specimens in the offices of Augustus Laver, (Architect of the S. F. City Hall) Kearny St.; David Farquharson, Architect, Cor. Kearney and California St., S. F.

Orders may be left with George W. Thompson, on the premises, or A. T. DEWEY, SCIENTIFIC PRESS office, No. 338 Montgomery St., S. F., where samples of the stone may be seen.

THOMPSON & DEWEY.

PAUL'S PULVERIZING,

Self-Feeding and Self-Discharging

BARRELS,

For the reduction of ores, dry, to an impalpable powder or any given fineness, are made of any capacity—4, 6, 10, 20 or 50 tons per day. The reducing material is quartz from mine working upon coarsely-crushed ore from batteries or other machinery. No ore discharged for amalgamating that does not pass through wire cloth having eight thousand and one hundred holes to every square inch of surface.

The practicability of these barrels are established by the working of hundreds of tons of ore. Several are now building at the Miners' Foundry and can be seen by those interested. For particulars appy to

ALMARIN B. PAUL,
22v25 No. 218 California street, up staire.

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS,
SAN FRANCISCO, November 25, 1871.

SEALED PROPOSALS FOR FURNISHING CERtain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;
Stone for Facing of Basement Story and Building the same in the Walls, etc;
Rolled Iron Joists;
Iron Girders and Columns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc;
Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposals can be had on application to the Secretary, and the Plans and Drawings can be seen, and all further information—as to the details of the work, etc.—can be obtained from the Architect, at the office of the Board.

The Bids must be endorsed for the Material proposed to be furnished or Work done, and addressed to the Secretary of the Board.

No Bids will be entertained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the due entering into the contract of the party to whom it may be awarded, or to be forfeited, if the party fail to enter into the said contract.

Each bidder for Brick will state what quantity he will furnish within one year, and at what times he will deliver them. Samples must accompany each bid.

The Board reserve the right to reject any or all bids.

Payments will be made monthly in "City Hall Warrants," of 75 per cent. of estimated amounts due, and the remaining 25 per cent. when the contract is completed.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

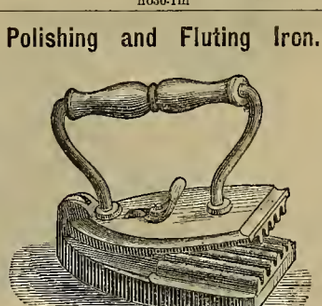
Polishing and Fluting Iron.



This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for Fluting is made of brass, and highly polished. The Polishing Iron and Fluter, being in one, are both heated at the same time.

We are now prepared to furnish them in quantities to suit.

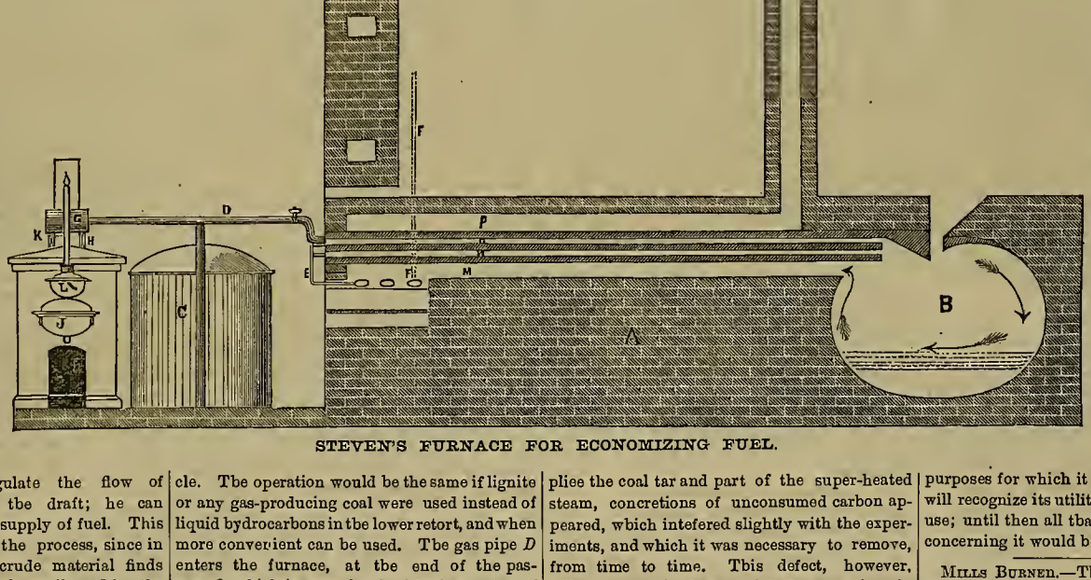
SAN FRANCISCO, SATURDAY, DECEMBER 7, 1872.

VOLUME XXV. Number 23.

Important Invention—a New Furnace for Economizing Fuel.

Tbere is now in operation at Garratt's Brass Foundry on Fremont street, an improved furnace which, if it proves all tbat it promises will, witbout doubt, revolutionize our present method of generatiug steam, working iron, smelting ores, etc. Tbis furnace has recently beeu introduced on this Coast by Mr. Levi Stevens, the iuventor, who, with many wbo have seen it in operation, is very sanguine tbat he will be able to do away with tbe use of cbarcoal etc. as fuel in our smelting operations, and coal in working iron. A sectional view of the furnace is shown in the accompanying cut, although differing, materially, from tbe one now running in this city. The one we saw iu operation consists simply of a heating chamber with its inlet and outlet for tbe gases in close proximity; from the rear end a pipe passes tbrough to the beating chamber, which conveys tbe oil or other substance, wbich feeds the fire, from a receptacle placed on top of the furnace. A jet of snperheated steam forces this coal tar (in this instance) into the chamber, where it is instantaneously converted into flame. Snperbested steam is also forced in from the rear end of the chamber to aid in tbe combustion, and the fire is entirely nnder the control of the operator from his being able to regulate the flow of steam and consequently tbe draft; he can also of course control the supply of fuel. This is, however, only half of the process, since in tbe complete furnace no crude material finds its way to the fire, the coal or oil used in the process being retorted and only the vapors used as gas.



STEVEN'S FURNACE FOR ECONOMIZING FUEL.

By reference to the cut the reader may see the plan of operation. *A*, represents the body of the furnace and *B*, the chamber, whicb is circular in vertical section, with its top slightly flattened. This chamber, whicb is heated by gases produced according to tbe processes hereinafter described, has its opening for the inlet of gases at one end, and its outlet for the waste products of combustion in close proximity thereto, and slightly above the inlet as shown, so that the gas and flame, before escaping from the chamber, is caused to pass entirely around the chamber as indicated by the arrows, thus creating a reverberatory action of tbe flame and producing an inteuse heat in tbe chamber *B*, the gas or flame thereafter escaping up tbrough the flue. A sbaft with projections somewhat after the manner of the Stetefeldt furnace is employed for ores. The chamber is provided witb the usual doors or openings for drawing off metal, etc.

To geuerate the gas to be used for heating tbe furnace an ordinary furnace is provided, over which is placed a compound retort consisting of two retorts, *I* and *L*, located one above tbe other and connected at or near their rear end by a passage or opening. The upper retort is conected by a pipe with an bydraulic main or trap *G*, from which a pipe *D* extends to the furnace *A* and enters it at one side, as hereinafter described. A gasometer *C* is also provided, and connected by a branch pipe, as shown, witb the main pipe *D*, this being for the purpose of receiving and holding any surplus of gas tbat may be generated, aud insuring a steady snpply of gas to the furnace.

A steam pipe *E* is arranged in the furnace at tbe rear end connecting with a superheater for superheating steam. This is heated by the fire from the furnace and tbe steam is taken from a boiler at any distance from tbe furnace, but not shown in the drawing. Tbe lower retort *J* is supplied with petroleum or any suitable carbon, and the upper retort is merely a receptacle. The operation would be the same if lignite or any gas-producing coal were used instead of liquid bydrocarbons in tbe lower retort, and when more convenient can be used. Tbe gas pipe *D* enters the furnace, at tbe end of the passage *O*, whicb is on a level with the center of the furnace *B;* so it will be seen that the flame of burning gas is deflected at an angle on the material in the furnace and from thence passes on around and up the opposite wall as tbe arrows indicate.

By this metbod of introducing the gas into the fire chamber B, it is caused to circulate entirely around it, and keep up a continuous reverberatory motion until it finally escapes therefrom, thus heating all parts of the cbamber equally, in the manner of a reverberatory furnace. In the formation of protoxide of carbon by a union of the oxygen of tbe steam witb tbe carbon of the bydrocarbons employed, as is done by this process it is necessary that the steam ehall be heated to a temperature equal to that required to convert the hydro-carbon or carbonaceous matter used, into a vapor or gaseous form. The heat generated by the gas produced by the nnion of tbe superheated steam with vapors, or gas produced by tbe distillation of hydro-carbons or carbonaceous matter is very intense, and would be admirably adapted to tbe chloridizing, desulpburizing, reducing and smelting of oree. The super-beated steam coming in contact with the carbon vapor under pressure, combines with it, and forms the highly combustible gas that produces the requisite heat.

Tbe advantages claimed for this invention are the utilization of the large bituminous deposits of the country, such as asphaltum, shale oil, etc.; to furnisb a flame that will desulphurize and reduce ores, where other forms of fuel are scarce and expensive; to furnish a flame tbat when used in smelting ordinary iron ores will completely desulpburize, carbonize, and convert it into steel at one process, and produce a cheap beat for generating steam.

All attempts to utilize asphaltum as fuel have heretofore failed, on account of tbe imperfect combustiou of the carbon, but Mr. Stevens claims tbat the whole of tbe carbon is consumed in tbis case. The small furnace in operation at Garrat's is rather defective in this, since at the end of the pipe which supplies the coal tar and part of the super-heated steam, concretions of unconsumed carbon appeared, which intefered slightly with the experiments, and which it was necessary to remove, from time to time. Tbis defect, however, will not occur in tbe complete furnace, siuce in that only the vapor of tbe hydro-carbon is used. In this particular furnace coal tar is used from which so much of tbe hydrocarbon has been vaporized as to render tbe full utilization of all the carbon impossible. Tbe furnace now iu operation is fed by a pipe, running from the receptacle or tank, to the fire chamber, and at the end of this pipe the superheated steam and tbe oil come togetber in a peculiarly formed chamber, where the superbeated steam forces the hydro-carbon against a deflector, where the heat and fire togetber completely atomize it; tbe superheated steam and particles of hydrocarbon combine and form carbonic oxide—an intensely inflammable gas. At tbe extreme rear end of tbe passage, a pipe witb a number of jets is placed from which a larger quantity of superheated steam is ejected into the furnace.

A complete furnace constructed in the same manner as tbat shown in our cut is being erected in tbis city for smelting purposes, which will be submitted to a crucial test. Tbere is no doubt that if it works as well practically as it appeare to, that it will be of vast advantage to this coaet in particular. We have in many of our mining dietricts immense deposits of emelting ores, wbich can not be made available by processes now iu vogue, but whicb wbeu tbe price of fuel is reduced, cculd be utilized to advantage. We have extensive deposits of asphaltum, whicb are practically inexbaustable, and which can be procured at comparatively little expense. Tbe iron sands of tbe northern coast could also be msde available and another prodnct added to our material resources. Our great want on this coast is cbeap iron, and it is affirmed tbat tbe "black sands" contain a very large proportion of magnetic iron, which only expense of fuel has bitherto prevented from being extracted.

We believe Mr. Stevens is on tbe right track, and only patience and perseverence are required to develop his invention and bring its merits practically before tbe publio, when his reward will be certain. If this furnace succeeds, tbe long mooted question of cheap fnel for steamships is partially solved. It must be tested practically for that of course as for other purposes. Theoretically tbere seems to be no apparent drawback, but tbe world is proverbially prejudiced against untried pieces of mechanism or processes, nor will popular opinion express itself in favor of anything until the proofs of its value, economy, or usefulness, are enforced upon us by the fact that it has stood the test of time and practical trial. When Mr. Stevene is able to erect a furnace which shall show the *whole* of his process, and its perfect adaptability to the purposes for which it is constructed, the public will recognize its utility and take it with general use; until then all tbat we could say *theoretically* concerning it would be of no avail.

Mills Burned.—Tbe Sebastapol, 12-stamp mill, better known as Ben. McCauley's, at Boston Ravine, was, according to tbe Grass Valley *Union*, burned down recently. The property was worth about $15,000, on which tbere was an insurance of $10,000.

The Oregon City Woolen Mills, at Oregon City, were burned on the morning of the 23d ult. Loss $150,000; insured for $80,000. The annual consumption of wool amounted to 500,000 pounds and the mills had gained a celebrity in the excellence of its mannfactnres.

The Horse Disease.—Tbere are rumors to the effect, that a disease similar to the one so prevalent at the East, but of a milder type, has made its appearance among the horses of this city; but we doubt its presence here, as after careful inquiry we can find nothing tbat appears any nearer to tbe real malady, tban severe colds and some fever in a few instances. Owners of horses cannot be too carefnl in exposing their horses to cold and sudden changes, and to the close, impure air of too many of our city stables.

Precautions against Fire.—The Municipal authorities of San Francisco have ordered 20,000 feet of carbolized hose, and two new enginee for the use of the Fire Department. Tbe engines are to be of the Amoekeag pattern, one of them with a self-propelling attachment.

Mineral Resources of Northwestern California.

We condensa as follows from an intercsting letter by a correspondent of the *Bulletin:*

A trip recently mads across tbe northwestern portions of tbe State, leading through Trinity, Del Norte, Klamath, Humboldt and Mendocino counties, gave opportunity for seeing much of a region the natural wealth and other attractions of which must soon bring it into more general notice and draw thither multitudes seeking profitable employment and permanent homes. Remots and hard to approach, it has heretofore remained the least known and densely settled of any section in California; its population sparse, wide-spread and strangely made up, consisting mostly of miners and Indians at the north, and of lumbermen and a nondescript race, half hunter and half stock grower, inhabiting the belt lying between the Coast Range and the sea.

In classifying these people with reference to their progress in enlightenment, the miner and lumherman fall into one catalogue, the Indian and the back settler into another, with a moral shade in favor of the aborigine! the fact being tbat to anything like an advanced civilization much of this region remains still virgin. Yet it has the capabilities for making a grand country; and with a railroad approaching it on either hand must soon attract to it a more numerous and thrifty class of settlers. Already capitalists are beginning to look after the mines at the north, while herdsmen are driving in their flocks to feed on the oat and clover covered hills near the coast. There is not a finer grazing or grain-growing district, than some portions of Humboldt and Mendocino, in all California, while for lumber there is not ánother such a country lying under the sun. In the matter of climate, too, this northwestern corner has some advantages over every other part of the State, being favored with more abundant and timely rains, with a moderate summer heat aud mild snowless winters, except on the mouutains. Already the rain had set in there and fallen copiously two weeks ago.

The Mines and the Railroads.

As is well known, a vast extent of gold placers have long been worked and are still paying well, in some of these northern counties; the business, through the aid of ditches, having for the last year or two been on the increase. There are also thousands of rich quartz lodes there, the development of which is now being actively entered upon, the natural facilities for working this class of mines being unsurpassed. As yet there is a lack of wagon roads for conveying heavy machinery; but these, to the extent required, can be easily supplied, while the railroad up the Sacramento valley, which is to cross the eastern border of this region, will put it within easy communication with San Francisco. Already this road is completed with the care running to Reading, whence there are but about fifty miles of staging to Weaverville, an important mining centre. The mineral resources of this region are not, however confined to the precious metals; the useful, some of them in great quautity, being found as well.

Cinnabar and Copper.

Near Trinity Centre, forty miles northeast of Weaverville, on a high ridge, between the forks of Trinity river, is a tract, nearly one mile long and a quarter of a mile wide, abounding in a wonderful manner with small veins and fragments of cinnabar. The formation here is a sandstone covered with a clayey soil, through which these veins and stringers run in every direction. On the decomposition of tbe latter, through exposnre to tbe elements, their remains have been carried away and scattered throughout the surface earth, a large proportion having afterwards been deposited by the action of water in the adjacent ravines. Scarcely a pau of this top soil, taken up at random, fsils to show some, and very often a large prospect of ore. To a depth of several feet it would probably yield one per cent. of cinnabar.. Dirt gathered from the gulches often yields from one to three pounds of ore that will retort seventy or eighty per cent. of quicksilver. Many of these stringers are also astonishingly rich in metal; and should they be found to gather up iuto a main vein, as they most likely will, we may expect here such a deposit of cinnabar as, properly managed, might be made a very formidable antagonist to the monopoly that has so long oppressed the mining interest of the country, if it did not break it up altogether.

Certainly, no such promising surface indications of cinnahar have ever before been found on the coast; nor have explorations here been altogether confined to the surface, a number of ebafte having been sunk on theee stringers to a deptb of 18 or 20 feet, showing always an increase in their volume and richness. This fact tends to establish their permanence, and that they are really offshoots, or feeders, of a ceutral vein eomewhere in the neighborhood seems probahle. The owners of this tract, a wealthy and enterprising Sau Fraucisco company, will prospect it thoroughly; and if meeting with the encouragement expected, will proceed to erect works for the reduction of the ores on the ground, to which end there is every facility—a sufficiency of water for furnace use close by, and enough within a mile or two to drive any amount of machinery, while the country about is covered with magnificent forests.

Large quautities of this cinnahar, owing to its high grade and mode of occurrence, could be disposed of in ite crude state, being in demand for the China market, where it is seut to be manufactured into a pigment much used and greatly esteemed by that people. Dealers in San Francisco pay 40 cents a pound for 70 per cent. ore, of which a great deal could be gathered here by sluicing the dirt as in gold washing. This method of collecting the ore could for some time, and until the richer deposits and surfaces earth were disposed of, be carrisd on with large profit, it being estimated that each man set to work could, while the water season lasted, earn from $30 to $50 daily.

The present owners havs secnred a good title to the whole of this tract, having bought out the original locators who made the discovery by the float ore met with in the ravines where they wers mining, over a year ago. The California and Oregon railroad will in the course of a few months he completed to a point opposite and distant not more than ten or fifteeu miles from this spot, affording chesp transportation to and from San Francisco. That this is a property of considerable valne seems probable; it has, at all events been prononnced such by a capable expert recently sent to examine and report upon it.

Running near this cinnabar bed is a copper-bearing belt carrying a good many fine looking lodes, on some of which a large amount of work was done at the time of the copper excitement several years ago. A number of lengthy tunnels have been rnn here, opening up fine bodies of ore; and should present prices of copper be maintained, work on these mines will no doubt be resumed at an early day, as the ores could he cheaply reduced on the ground or shipped away for a market.

At Low Divide, 18 miles north of Crescent City, a locality visited in the course of my journey, there are also some valuable copper mines, from some of which a considerable quantity of ore was taken and shipped to San Francisco at the period above alluded to. The ore here is of the gray variety and of good grade, the bulk of it assaying from 18 to 20 per cent. in metal. The lodes are mostly large and well formed. The Union, the most extensively opened, carries, at a depth of 300 feet, a three-foot stratum of solid ore. Here, too, there is timber and water in the greatest abnndance, with a good wagon road to Crescent City, affording advantages for working the ore at the mines or sending elsewhere to market.

From Weaverville to Hoopah Valley.

Having gone out of the way to see this network of veins and the curious feature of a cinnabar placer, I came down to Weaverville and struck out for Klamatb Bluffs, 120 miles away, following the sinuosities of the streams and mountain trails. At Weaver there is an end of staging, the journey beyond being made on borsehack and canoe, there being some stretches of the Trinity and Klamath rivers navigable by that sort of craft. The country to be traversed is an almost continuous succession of rugged mountains and deep ravines, the former crowding upon the rivere at many points so closely that the traveler is forced to pass over them. Tbe journey is fatiguing and not everywhere unattended with danger, the path in some places ascending for thousands of feet up the precipitous sides of the mouutains, and so narrow that the rider must dismount and lead his animal cautiously along, as a single misstep might hurl both to destruction. There is a wealth of timber on these mountains, but the trees, though gigantic, do not stsnd eo thick as in the redwood forests near tbe coast, where they often crowd each other so close that they can grow no more, unless it he upward. In these woods deer and bear abound, as many as fifteen or twenty of the former ofteu being seen in a herd. The streams also afford good angling, being at all times full of mountain trout and salmou.

Mining on the Klamath.

About 40 miles below the Klamath Falls, I visited the theatre of an important mining enterprise, also in the hands of San Francisco operators. At this point the river—owing to the occurrence of a slide—has been forced from its ancient channel, leaving an immense deposit of auriferous gravel occupying its former bed. As much of this gravel having been worked off by hydraulic washing as was practicable, without the means of ridding it of water, the property lately passed into the hands of men of large means, residing in this city, wbo are about eupplying the requisite pumping apparatus, with a view to working out the lower stratum of gravel, which is known to be immensely rich and very extensive, this bed being fully a half mile wide and over a mile long. The river supplies power for driving the pumps, a ditch, already constructed, briuging in water from a mountain stream, four miles distant, for washing purposes. This enterprise will soon be under way, and great results are anticipatcd from the working of the remaining portions of this bar. The gravel here is free from large boulders, and so loose that it can be easily broken down and disposed of. While many other large hare on the Klamath, both above aud helow this point, are being worked by hydraulics, a still greater number are wholly neglected, there being here many good opportunities, for parties having the necessary meane, to engage in this branch of mining.

Origin of Gold Bluff and the Adjacent Beaches.

Starting from the eouth side of Klamath at a point 15 miles from the ocean is a deep depression extending thence and terminating in Gold Bluff, situate 12 miles eouth of the river's mouth. Through this depression the Klamath once flowed, ite waters having been obstructed by the debris brought down by some great flood and forced to find a paseage to the sea through their preseut channel. Gold Bluff is nothing but ths accumulations of auriferous gravel dsposited by this ancient rivsr, largely increased, most likely by this flood. The promontory tbus formed, having afterwards been washed away by ths surf, lsft the present Gold Bluff. The auriferons beaches to the north and south ars mads up of the portions swspt away and cast up at the particular points by the eddies of the sea. What this is, the origin of the original Gold Bluff is svident enough; tbe discovery of this old river bed furnishing a key to what had so long remained a mystery.

San Bernardino County Mines.

A corrsspondent of the *Alta* writes as follows concerning the mineral resources of the country around San Bernardiuo, especially in the direction of Ncvada, which he says have been unaccountably neglected. Rich specimens of ores, containing silver, copper and lead, are constantly being brought in from the range of mountaine east of the town, and there the matter rests. Lsst week several rich copper and silver ledges were discovered by a party of prospectors only sixty miles from town. Tbey mean business and more will he heard from them soon.

The prospecting spirit seems to have been only just awakened, notwithstanding the San Jacinto tin mines, on the southwest, the Abadie placer (bydraulic mine, yielding $100,000 last year) at Lytle Creek, eight miles to the northwest, and the rich districts of Ivanpah, Clark, New York and others, to the east, have been staring experience in the face for years.

A lone hill in tbe plain, about nine miles from San Bernardino, has been prospected and pronounced a mountain of tin, within the last week.

There is room for mining enterprise here snd profits are almost sure to the explorer. Between San Bernardino and Salt Lake the inducements to prospect and invest capital are very flatteriug at present, and the public need not be eurprised at any time to hear of uew wonders.

It cannot be so far in the dark future that the observer should fail to see the destiny of San Bernardino. It is the key to an immense county and will soon be connected witb San Francisco, San Diego, Los Angeles and Arizona, and possibly with Salt Lake. It has beeu so far out of the way of travel and so isolated that its resources have never been well known to the public. With the exception of those wbo have hurried through the valley on their way to Northern Arizona, or on their return, very few outside the county know anytbing about it.

When these things change—as they surely will—and a tide of emigration pours in, there will be this advantage: in San Bernardino they will find a population already living tbat asks no odds of fortune, and that is as independent as any in the world.

Indian Relics and Remains. — Lately, two young boys, William and Hiram, sons of B. R. Holliday, wbo reside in the Franklin cañon, about 2½ milee from Martinez, observed in the bank of the creek, which had been much washed hy the heavy flow of water last winter, tbe rounded surface of a dark, polished stone, wbich they made an effort to remove, but found so fast imbedded that they resorted to the use of their knives, and, after much digging, got it out, and fonnd it to be an Indian pestle of perfect form, smoothness and polish, and some ten or eleven inches long and three or four in diameter, two-thirds of the length, and diminishing one-third of the length to a blunt, rounded point. In extracting tbe pestle, the boys found that it was covered by and extended into the cavity of a large, round boulder, which was found, on excavation, to be an Indian mortar, having a perfectly hollowed howl, some six inches deep and seven or eight in diameter. The mortar, though not measnred, must be nearly or quite sixty inches in circumference, and weighs in the neighborhood of 200 pounds. It has the form of a sligbtly-flattened, well-rounded duck egg; and has evidently been artificially shaped in exterior form, as well as in the bowl, and looks as fresh as if it had but yesterday been turned off from the Indian sculptor's hands, while the polish of the pestle is smooth and lustrous as if it had been in daily use for the hundred or two years, at least, that it must have been lying under the inverted mortar, as shown by the level of five-feet accumulations of the valley-surface stratum of soil above the yellow clay upon which it was found, together with the partially-decomposed remains of a human frame, portions of which, consisting of the skull, thigh, hip, finger and other bones, Mr. Holliday brought into town with the stone relics on Tuesday last.—*Contra Costa Gazette.*

New Mining Operation.—We are glad to be able to chronicle the inauguration of a new mining enterprise in this vicinity upon an extensive scale. Messre. Simpson & Hoffman, a couple of gentlemen recently from Inyo county where they have been largely interested in mining operations for several years past, have purchased a number of claims on Tunnel ridge and will consolidate them in one mammoth hydraulic. Work has already been commenced, and it is contemplated that everything will be in readiness to commence washing by the time the rains set in. It is the intention of Messrs. Simpeon & Hoffman to use a very large amount of water, and they are making preparations for an active "campaign" dnring the winter. Their hydraulic will be among the best appointed aud most extensive in the county.—*Calaveras Chronicle, 22d.*

Quicksilver Deposits—Are There any in Nevada?

We have been informed, says the *Territorial Enterprise,* that a gentleman in Flowsry has ssen in the hands of an Indian a fine looking specimsn of cinnabar, weighing, probably, four or five pounds. Ths Indian said he picked it up in the low hills skirting the west side of the desert, and intimated that more of the ore could he found in the same locality. Through some oversight the Indian was allowed to depart with his specimen, and has not since been seen by tbe gentleman to whom the ore was exhibited. It is to be regretted that the Indian was not induced to accompany some one to the spot where the specimen was found. The news of the discovery of a cinnabar vein in this State would be most gratifying intelligence to tbe mine and mill owners. An enormous quantity of quicksilver is consnmed in Nevada, and the price (ninety cents per pound, we believe) very materially augments the cost of reducing our gold and silver ores. We are supplied from the New Idria and New Almsden miuee of California, which contribute within a fraction of the entire quicksilver yield of the coast, or of the United States, for that matter. Cinnabar mines are very sparsely distributed over the face of the earth. Small deposits of uo real value are frequently found, but nineteen-twentietbs of all the quicksilver produced must be credited to less than a dozen minee.

Next to the Almaden mine of Spain, the New Almaden of California, is the largest producer. The annual quicksilver yield of the world is estimated at 7,000,000 ponnds, one-third of which is the product of the New Almaden and New Idria mines of California. The opening of these mines very materially affected the price of quicksilver for some years; but lately the price hae been advanced, and unless the market be relieved by new discoveries, there is no telling what we may be compelled to pay for quicksilver before the end of another decade. Our orcs cannot be reduced without quicksilver, and unless a substitute be found for it, which is not probable, it will soon form a leading item of expense in the workiug of our mines. The consumption of quicksilver is increasing rapidly—especially in California and Nevada, where new gold and silver miues are being opened almost daily. The increased demand for it, without an adequate increase in prodnction is one of the causes of the advance in the price of quicksilver. Another cause was the formation, not long since, of a gigantic quicksilver "ring," of which tbe Rothschilds are controlling members.

The leading minee of Europe are the Almaden and Idria, both of which are under lease to the Rothschilds. In fact, it has been stated that the Idria and other mines in Austria have been mortgaged to the Rothschilde by the Austrian Government. Certain it is that the most of tbe qnicksilver product of the world is monopolized hy a few companiee acting in concert in the regulation of tbe price, market and annual product. The aggregate yield could be increased fifty per cent. without difficulty; but the annual product of each mine has been agreed upon, and fixed at figures which will leave the market continually hare, and compel the payment of just snch prices as may he demanded. The qnicksilver "Ring" is complete, and our only bope is in new discoveries in California and Nevada. Many small deposits of cinnabar have been found in California, but thus far their product hae amounted to little or nothing. One of the most promising of these discoveries ie on Squaw Creek, in Sonoma county. The mine has recently been purchased by a San Francisco company for $30,000, and measuree for its thorongh development will be taken at ouce. Tbe deposit is believed to be both rich and extensive, and several other mines, it is thought, will be opened in the same locality. We started to speak merely of the possible existence of cinnabar minee in Nevada, aud have been led somewhat from the subject. In view of the immense value of cinnahar depoeits capable of producing quicksilver in paying quantities, and of the fact that specimens of cinnabar have frequently been found in this State, we would suggest that some attention by prospectors be paid to cinnabar as well as gold and silver.

Nevada and Arizona.—Some of the leading operators in the Comstock have concluded to inveet small sums in the rich mining regions of Arizona, aud to that eud are making up a company to back Forey Gregory. The organization is to be known as the "Virginia and Gold Hill Mining Company," and is to be compoeed of ten membere (including Gregory), each of whom subecribe an equal amonnt toward defraying the expenses of the trip. Forey Gregory is a practical miner, an old prospector, a courageous and venturesome mountaineer, and has explored Arizona from Ehrenberg to Verdi, from Granite District to Vickenberg, from the Black Hille to Walnut Grove, and from Wallapa to Weaver Hill. He is familiar with every road, stream, mountain range, pass and Indian trail in the Territory, and, going there full of life, ambition and energy, and with the money to enable him to prospect to advantage, we doubt not the gentlemen who have invested in the enterpise will ultimately find it to be the best investment they have ever made in mining operatione. It ie the intention of the company, through their agent, to locate agricultural and timber lands, water privileges, etc., as well as mining ground.—*Virginia Chronicle.*

MECHANICAL PROGRESS.

Testing Steam-Boilers — An Excellent Suggestion.

The boiler in which is generated and the engine in which is utilized the great motor, steam, are undoubtedly the most important inventions yet discovered. and it is not too much to say, perhaps, that in perfecting them more careful study and investigation have been brought to bear than upon any mechanical subject. Of late, steam-boilers have been the especial object of a class of inventors, some of whom differ widely from others in their views and applications of the principles involved. We have seen one inventor claim as an especial advantage in his boiler the doing of what another claimed as the special merit of his to prevent. Of the business men who have occasion to purchase and use boilers, comparatively few have the time, or inclination, or technical education necessary for correct judgment upon the subject. Hence, while the conflicting views and construction of boilers cannot all be right, they all have their patrons and advocates. It is of the first importence to determine as accurately as it is possible to do the relative merits of all the different syetems. Theorize as accurately as we may, there is still a large margin of uncertainty which can only be made certainty by experiment. Which is the most convenient, the most durable, the most economical, and above all the safest boiler, is a question in which every individuel is more or less directly interested. A communication published in another column, from a gentleman who has given much attention to this subject, contains suggestione which we heartily indorse.

He proposes that those directly interested in steam motive power in thie city and vicinity be requested to subscribe to a fund, for which the American Institute shall also appropriate a sum of money, which fund shall he used under the direction of the Institute in making prolonged and exhaustive tests of the different systems of boilers, and that the results of the investigation be carefully and candidly published for the information of those interested. The character of the American Institute ehonld be pledged to the impartial and candid treatment of the matter, and the benefit to be derived would a thousand-fold repay the trouble and expeuee. The proposition shonld find favor at once.—*American Artisan.*

Recording Sounds, Etc.

Few people are probably aware of the extreme difficulty in keeping a *correct* count by the eye or ear of repidly repeated blows, even when they are eupposed to be fully within the reach of our power to thus record them in the mind. We ere often widely at variance from the truth, when we are fully persuaded in our own minds that we are correct. Ae an instence of this fact Mr. Coleman Sellers, recently having occasion to count the blowe of a rapid etrikiug eteam hammer, which was thought to be making three hundred blows per minute, three careful observere, conuting the blowe at the same time, made a variation of from 275 to 325 in the eame count. Believing that such obeervation could not be relied upon, he connected a recording telegraph instrument to the machine, placing two keys in the circuit. One key wes closed by each blow of the hemmer, a wire from it being attached to a rock shaft in the velve motions; the other key to be closed by hend. When the hand key wes cloeed, dots were recorded on the paper ribbon, one dot to each blow of the hammer; and by keeping the hand key closed any definite time, e row of dots, equivalent to the number of etrikes in thet time, were recorded, which dots could be counted afterwards at leisure. Many experiments were tried with this epparatns attached, and, as a rule, it wes found that moet persons who ettempted to count when the speed wee neer 300 blowe per minnte, over counted rather then under counted. Very seldom did the count of any observer tally with the count of the instrument.

NEW METHOD OF STOPPING LEAKS.—An ingenioue method of stopping leeks in iron ehips when at eee has been patented in England by Mr. McCool, who effects his object by means of what he calle "safety-pletes." These pletes are, as artisans eay, "dished"—thet is, they resemble a dish in ehape; consequently, when the hollow side ie pressed egainst the platee of a ship, the "safety-plate" fits closely, and will keep water out when held firmly in place with ecrews. By a clever contrivance, when once the leak ie dscovered, means can at once be teken for fitting on the new plate. A weighted line ie dropped through the hole; this is laid hold of by lines drawn under the ship, the weight is taken off and replaced by a screw bolt; a plate, with India-rubber covering the inner edges, is next screwed to the bolt, dropped overboard and drawn into position by the line hanging through the leak; an inner plate is then ecrewed to the inner end of the bolt; and thus the leek is completely covered on the inside and on the outside, and the water is kept out. That this means of safety can be made uee of in the open sea, and under different circumstances, without the necessity of docking the ship, is not the least among its recommendations.

American versus Foreign Leather Belting.

By far the larger proportion of belts are made in the United States, which are conceded by the best judges to be superior to those made in any other country in the world, those of English manufacture not excepted.

The fact was well demonstrated by a practical proof lately afforded. A manufactory in Scotland had an order to give for a large amount of belting, and wanted to obtain the best goods in the market. Proposals, samples being furnished, were made by leading European manufacturers for all the heavier belts desired. A well-known New York house, however, that of J. B. Hoyt & Co., obtained the order and the unqualified indorsement of the Scottish house as to the superiority of their belts. We have seen some of the samples which were submitted by the foreign competitors for this order, and, while the leather was, in some cases, of good quality, the manufacture of the belts was of the most clumsy and primitive character.

We think we are not overstating the case in saying that in neither France nor Germany do they know how to make, or do they make, any very large proportion of first-class belting leather or sole leather; in England, where the tanners, as a rule, have well earned their reputation of making the best sole leather in the world, the tannage is generally too plump and hard for the best belt leather; for, while we believe it is hardly possible to put too much tannin into leather to be used for soles, we think it is clear that, when the hide hes more tannin than necessary to make it of its original thickness as taken off, its tensile etrength is thereby diminished. For belts we want tensile strength and pliability; for soles we do not so much need pliability as the compactness which will resist water, and the toughnese which will beer a great deal of attrition. The English tanners are eminently successful in obtaining these latter qualities. The difference, however, ie not very plainly marked between good belt leather and good sole leather, except that the former requires much better eelection of the parts of the hide to be used, and for large belts only the best parts of whole hides can be used. In France and Germany, however, although their calfekine and upper-leathers are euperior to those made anywhere else, their sole-leether tenning is equally inferior, is done in a very tedious and slovenly way, and their tannere are at least a hundred yeare behind the age.—*Shoe and Leather Reporter.*

Persevering Inventors.

A true inventor is alweys hopeful, even under the most edveree circumstances. Patiently will he toil in pursuit of the object that haunts hie brain, end no obstecles, however formidable, eeem to dampen the ardor of hie enthusiasm. The history of men of real ingennity ie full of examples that verify the correctness of what we have said respecting the perseveriug character of men of genius. Our own history and the records of the Patent Office are replete with examples of the heroism of inventore. Thomas Blenchard, the well-known inventor of the eccentric lathe and other valueble improvemente, wes a notable example of what perseverance can accomplish. Elies Howe, Jun., in the midst of the deepest poverty, persevered with hie eewing-machine until he won complete euccese. Richard M. Hoe, Samnel Colt, Chas. Goodyear, Samuel F. B. Moree, Allen B. Wilcon, Cyrus H. McCormick, John Ericeson, Isaac M. Singer, Jerome B. Secor, John Bachelder, and e host of other inventors, knew no such word es fail; they stnck to their projects till success wes fairly wrenched out of edversities thet would have crushed other men. Many inventore seem to think that the field for great improvements is in eome degree filled up; thet the opportunities for great discoveries iu the erts are abont closed. Such, however, is not the case, the field is constantly widening, and there is es much encouregemeut to pereevere in invention es wes open to the men whose names we heve mentioned. It is only within the last year that one of the most valuable improvements hes been introduced in the art of transmitting messages by telegraph. And iu every depertment of mechanical and chemicel industry labor-saving inventions are still required, and will be for all time to come. We say, therefore, that the field open to persevering men of genius is still a lerge one.—*American Artisan.*

STATISTICS OF THE U. S. IRON INDUSTRY.—The completed returns of the ninth census, jnst sent to press, ehow the following facts in regard to the several branches of iron industry in the United States during the year ending June 1, 1870:—

Pig Iron.—386 establishments, 574 blast furnaces (with a deily capecity of 8,357 tons melted metal), employing 27,554 hands, producing 2,052,821 tons of pig, of the valne of $69,640,498.

Bloomary Forges.—82, employing 2,902 hands, producing 110,808 tons of blooms, of the value of $2,765,623.

Foundries.—2,653, employing 51,297 hands, and producing to the value of $99,837,218.

Forges.—102, employing 3,561 hands, and producing to the value of $8,147,669.

Establishments producing bar, rod, and railroad iron, nail, plate, etc., 309, employing 44,643 hands, and producing to the value of $120,301,158.

SCIENTIFIC PROGRESS.

The Field of Knowledge.

In allnding to the vast field with which the scientist is expected to nuke himself familiar in the present advanced coudition of science, Mr. J. H. Gladstone recently spoke bsfore the British Association as follows:—

"So intertwined ars the various branches of perfect understandiug of one sciencs can only observational or experimental research, that a bs obtained through an acquaiutance with the whole cycle of knowledgs.

Yet, on the othsr hand, who can survey the whols field even of modern chemistry? There was a time doubtless in the recollection of the more venerable of my auditors, when it was not impossible to lsarn all that chemists had to teach; but now that our "Handbook" has grown so largs that it would teks a Briarsus to carry it, and it requires a smell army of abstractore to give the Chemical Society the substance of what is done abroad, we are coupelled to become specialsts in spite of oureelvee. He who studies the general laws of chemistry may well turn in deepair from the ever-growing myrieds of transformations among the compounds of carbon; we heve egricultnrel, physiological, and technicel chemists; one man huilds up new substancee, another new formulæ; while eome love the rarer metals, and others find their whole soul engrossed by the phenyl componnds.

How is this neceesity of specialization to be reconciled with the necessity of general knowledge? By our forming a home for ourselvee in some particuler region, end becoming intimately conversant with every feature of the locality and their choiceet associations, while at the same time we learn the general map of the conntry, so as to know the relative position and importance of our favorite resort, and to be eble—when we desire it—to make excursions elsewhere.

To facilitate thie ie one of the greatest objects of the British Associetion. The different Sections are like differcnt countriee, and leaving the insular seclusion of our especial studies we can pess from one to the other, and gain the edvantages of foreign travel.

From *this* Chair I must of course regard chemistry as the centre of the nniveree; and in speaking of other Sections I must think of them only in their relation to ourselves."

VARIATIONS IN SPECTRUM ANALYSIS.—Mr. A. Shnster presented a paper at the late meeting of the British Association in which he showed, very conclusively, thet the variations noticed in the spectra of certain gasses, es hydrogen, ammonie, acetylene, etc., was due to the presence of foreign eubetances, which were often communicated by the tubes employed to convey the gasses, especially where india rubber connections were made use of. Prof. Tyndal, in this connection, called attention to the fect when even a emall piece of india-rubber tubing was affixed to the end of a glass tube; and the air drawn through it into the month by snction, a distinct taste of the rubber was observed, ehowing that particles of that subetance were dieengaged by the friction of the air in passing over it. So delicate ie the spectrnm test thet even such infinitessimal amounts of a foreign substances mixed with the ges to be analyzed, seriously affects the resnlt. Such facts afford additional evidence of the need of the utmost precaution in employing this wonderfully perfect medium for purpoees of investigetion into the composition of substances submitted toite test.

CRYSTALLIZATION.—Crystale are built up in different wave. Some ere like glees, that is, there is no line which cuts the crystel in a particular way. Rock salt for instance is symmetrical. In others the moleculee are arrenged eymmetrically aronnd a single line. Ice is an instance of this. The consequence is that when ice is exposed to a beam of light perpendicular to the plaue of freezing it ie polarized, On account of this arrangement of the molecules of the ice, part of them are parallel to the plane of freezing and part are at right anglee to this plane. These act differently upon the ether. Crystals built np in this way are called uniaxiel cryetals. All nniaxial crystals have the double refracting power. They break the beam of light which passes through them into two beams. The most celebreted of the epeciesie the Iceland spar. In one direction eymmetry exists. This ie called the optical axie. when polerized light is sent through a crystal of this kind, those rays which pass throngh this opticel axis ere not affected. Those rays, however, which etrike this obliquely are broken up into two, the ordinary and extraordinary rays. These interfere and give rise to color.

SOUND WAVES move like the wavee of the sea. Prof. Tyndal iu a late Boston lecture, threw upon a screen an image of the pulsations or waves of sound as they were set in motion by a large tuning fork, and it was distinctly seen that, though the pulse moved over the whole screen, each seperate particle moved but a short distance, like the particles of water in the waves of that element.

A NEW FACT WITH REGARD TO THE SOLAR CORONA.—During the last eolar eclipss of the sun, Mr. Janssen, who meds his observations in India, nsed a reflecting telescope of vsry large diametsr and short focus so es to obtain a mors perfect and brilliant imsge of ths corona. By ths uss or this instrument he noticed that the redial polerization of the corona increased iu proportion to its distance from ths sun. This fact, which ie new and was first announced et the late meeting of ths Association of Engineers, adds much to the proof which is being gathered that ths corona really belongs to the sun, eud that the iuner or lower portion is more brilliant and hotter than the npper or outwerd.

Mr. Janssen elso described his method of so arranging his telescope that he could look through the finder with one eye end the spectorscops with the other, et the same instant of time. Prof. Herschel, who was present, wes much interested in the detail, and said that it wes all new to him.

On the eveuing previous this latter plan had been tried npon a distant gaslight, and had been fonud to work admirably. The observer could thus dstsrmins accurately what part of ths flame he was examining with the miscroecope.

ACTION OF LIGHT UPON GLASS.—Much attention hes recently been paid to the action of sunlight on colorless and colored glass—both that which is polished and that which is rough. Very perceptible chenges heve been observed from colorless to yellow, and from light yellow, green or blue, to darker or mellower shedes of those colore. Specimens of coffee colored glaes were in five years found to have materially chauged to rose and amber colore.

It is thought that the rich, mellow tones eo much admired in the old end richly etained cathedral windows, is due to the action of the snn-light, in a long succession of years, in toning dowu, what was most probably, comparatively bright or hersh toned colore originally; The action is thonght to be a photochemicel one. Numerous experiments have been mede with epecially colored glasses, with the view to aecertain whet coloring materiel will result in favoreble, end what in unfavoreble chenges. In many cases of ancient glass the putty has been fonnd to materially protect from change those portions which it hae covered. Oue of the most important precticel resulte hae been the proof that manganese should not be employed in gless to be used for light honse purposes. White glass conteining leed, even as emell as 5 per cent. does not appear to change at all.

A TIDAL WATCH.—Sir William Thompson, et e late meeting of the Engineers' Associetion at Newcaetle, npon Tyne, described to the association a new end convenient inetrument which he called a "Tidal Watch," which wes then in process of construction, nnder his eupervision, and neerly ready for exhibition. It would indicate the hight of the weter as dependent on the sun, the hight of the principel lunar and principal eolar tides, end would be edjustable to giving these facte for any given locality. The instrument would also ehow the time of high water. Sir William was also planning another similer mechine for tidel computations, which would give the exact hight of the tide for every moment of time. Thie would be shown by the elevetion and depreesion of the end of a clock hend, which would make one revolution corresponding in time to the rise and fall of eech tide. This device will eleo be mede eelf-recording by traceing the curve of the rieing and falling tide npon peper.

POSSIBLE CONNECTION BETWEEN CYCLONES AND SUN SPOTS.—Careful investigations are being made by collecting and comparing the log booke of a great number of ships, scattered over a series of years, to escertain the possibility of any connection between Cyclonee and Snn Spots. Nearly all the cyclones which have occurred in the Indian Ocean for the last 25 yeare have been carefully noted, and it is ascerteined that the years on which a maximnm in number and violence of cyclones have occurred, have also been those in which a maximum of snn spots have been recorded. This fact is thonght to be eomething more then a mere coincidence ae to time. There are three maxima and two minime epochs of cyclone frequency, corresponding ueerly, if not entirely with similer snn epot epochs. Theee enquiries are to be continned for verification or otherwise—what holds good with regerd to meteorological disturbancee in the Indien ocean, probably holds good over other portione of the earth's surfece.

TEMPERATURE OF THE MOON'S SURFACE.—Mr. Welford hae recently published a very attractive book on "The Orbs Around Ue," in which one paper is devoted to the letest developmente brought out by "Lord Rosse's monster Telescope" as recently employed in determining the temperature of the lunar surface. Mr. W. states that from a delicate series of experiments, only possible with an instrument of such immense power, it appears that the moon'e surface must be heated to a temperature of nearly three hundred degrees above the boiling point. This at once dieposes of the possibility of the moon's being inhabited by any beings such as exist upon the earth.

NOTE.—†—California. *—Washoe. ‡White Pine. §—Ely District. ¶Eureka District. ‖—Idaho. ⁞—Nearly.?—Over.

S. F. Stock and Exchange Board.

THURSDAY, December 5th, 1872.

The sales at the Board for the week ending Monday, the 27th ult., amounted to only $2,000,000, The month of November was not a profitable one for stockholders, the assessments heing numerous and ths dividends few. The Black Diamond Coal Co. disbursed ½ per csnt.—$25,000;the Eastport Coos Bay Coal Co.,1 per cent.—$2,500; Ccderhurg Gold M. Co., 50 cents—$12,000; Providence G. M. Co., 1 psr shars—$3,100; and the Raymond & Ely M. Co., $7 psr share, or $210,000. The Cederburg dividsnd is its second, and that of ths Providence its first. Ths total for mining companies ths month was $225,100, as compared with $273,000 in ths ssme month last year, or $294,-000 in 1870. The Belchsr and Crown Point minss omitted their dividends last month again, but ars expected to resume them in January, if not this month. Ths new mill of tbe Raymond & Ely mine needing repairs, it is prohahle that limited product will cause a reducton of their dividend this month. Ths Eurska (Grass Valley mine) is ths only one that has thus far declared auy dividend this month, it not having paid any since last January. It paid this month $1, per share, or $20,000. Ths North Star, in the same locality, is expected to resume paymsnts again nsxt month.

This week we have had almost a panic in the Stock Market. The reaction caused hy the exposs of the diamond swindle has bad a adepressing influence on mining sharss, and few orders are forthcoming. With ths resumption of dividends in some of our leading mines we may expect more interest to he taken in tbe Stock Market.

On Friday stocks were vsry dull, particularly for Washoe descriptions. As compared with prices of previous Wednesday, Belcher, fell $4; Crown Point, $7: Chollar, $5; Gould & Curry, $7; Hale & Norcross, $6; Savage, $5; Jacket, $3; Eureka Con., $1; Hermes, $2.75; Raymond & Ely rose $10.

Saturday, prices were a little hetter hut the improvement was not general, Alpha fell $3; Chollar-Potosi, $3; Exchequer, $1; Ophir, $1; Hale & Norcross, $4; Savage, $4; Gould & Curry, $20; Raymond & Ely. $14; Hermes, $2. Overman rose $3; Yellow Jacket, $2; Pioche, $1; Sierra Nevada, $1.

On Monday there was very little businese, and prices showed no material cbange, Savage rose $4; Yellow Jacket, $1; Hale & Norcross, $2; Meadow Valley fell $1; Belcher, $2.50 and Cons. Virginia, $3.

On Tuesday the market continued dull, with few changes in prices of stocks.

Wednesday very little husiness and few orders; Crown Point advanced $3; Hermes, $4; Chollar fell $11; Gould & Curry, $20; Savage, $5; Hale & Norcross, $10; Ophir, $3; Cons. Virginia, $25; Yellow Jacket, $13; and Raymond & Ely, $5.

To-day ths market showed its nsual dull and heavy character, Washos descriptions in particular experiencing a declins. The prices of to-day as compsred with thoss of last week will bs seen by refering to our "Stock Tahles."

Below is news from ths prominsnt mines latsr thsn that found in our "Mining Summary."

HALE & NORCROSS.—During the week ending Nov 30tb, 880 tons of ore was extracted, and 687 tons sent to mill.

SAVAGE.—For week ending Nov. 30th, 1,260 tons of ore were sxtracted, assaying $26.10 per ton; 1,124 tons wsrs delivsred at mills.

BUCKEYE.—For wesk ending Nov. 30th, 105 tons of ore were extracted of an average assay valus of $21.60 per ton; 163 tons sent to mill.

RAYMOND & ELY.—On the 27th ult., $36,165 was shipped; on the 30th, $36,260 and on ths 3d inst., $36,000, or a total for Novemher of $369,255. On December account $35,989 has been shipped thus far.

PHOENIX.—On the 27th ult., ten tons of bullion worth $4,521 were sent down; 10 tons more were sent on ths 29th, assaying $265.10 per ton; on the 1st inst., 10 tons wsre sent, assaying $259.47.

From ths EMPIRE (Idaho) $2,426 was received on the 29th ult., and $2,521.28; on the 2d inst. Four hars of bullion were shipped from the SILVER PEAK on the 25th ult, Shipmsnts of hullion will soon commence from the MAHOGANY. Car samples from ths Belcher on the 3d inst., assayed $132. Four furnacss of the EUREKA CONSOLIDATED are running. A further ors improvement is noticeable in ths CHOLLAR POTOSI. The NOONDAY got $85 psr ton from 48 tons of ore. Rich ore is reported in ths PEAVINE. Last weekly clean up of the EUREKA (Grass Valley) for ten stampe was 1,700 ounces of amalgam. The mill of the COLUMBUS M. & M. Co. started up all right on the 28th ult.; mine improving. From the MAHOGANY two hare of bullion worth $3,533 was sent down on the 29th.

PATENT DECISION.—In the United Statee District Court, San Francisco, in the case of William Gwynn against Sayward, Fonda & Co., of Mount Diablo, involving the right to letters patent to the Monitor Perpetuating Cylinder Lime Kiln, Judge Sawyer decided in favor of the plaintiff.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—Alpins *Chronicle*, Nov. 23: The raising of tbs hoisting works commenced this morning and will he enclosed hy Saturday next. On Monday week the carpsnters will rssume work upon the I. X. L.

MONITOR *Miner*, Nov. 23: Glance shaft on the 75-ft. level below tunnel has been, during three or fonr days past, improving very rapidly.

AMADOR COUNTY.

KENNEDY.—Ths new shaft is down over 100 ft. The new steam hoisting works are rapidly approaching completion.

BACON.—Work progresses finely, and the rock yields as flattering prospects as evsr. The new whim will bs in activs operation in a few days.

BUTTE COUNTY.

NEW MILLS.—Oroville *Record*, Nov. 30: The quartz mill of Halstead & Nishet, recently huilt, will bs in runuing order in ahout a wesk.

THE new quartz mill on the Reese ledge in Oregon Gulch, will soon bs ready to commence running.

CALAVERAS COUNTY.

HUGHES CLAIM.—Calaveras *Chronicle*, Nov. 30: The claim is paying well. It is worked through an incline eeveral hundred ft. in lengtb.

RAILROAD FLAT DIST.—The Sanderson ie turning out very rich ore at the depth of 160 ft. A emall streak of pay ore has heen struck in the north level of the Petticoat, 450 ft. helow the surface. Wolverine continues to yield higb grade ore in einking.

WEST POINT DIST.—The Seminole Co. are reopening the old Pascoe. Mining interests are improving.

SCIEFFARD.—San Andreas *Citizen*, Nov. 30: The Supt. says he ie down 96 ft., has drifted across the lode 17½ ft., snd struck the foot wall. Ths rock from this drift is very rich, containing free gold, and gold-bearing sulphurets.

NEVADA COUNTY.

GETTING READY. — Nevada *Transcript*, Nov. 28: At Sargent & Jacoh

ledges, rich in gold and silver, have been discovered.

The Thomas' boye bring in very good prospects. With water pleuty, it is thought $15 and $20 to the man can be made.

J. H. Martin returned yesterday, after having discovered a vein of black lead, 40 ft. in width. These mines are to the north of San Bernardino mountain, abont 40 miles from here.

SISKIYOU COUNTY.

A Chunk.—Yreka *Union*, Nov. 23: G. Smith showed ns a nugget of gold this week, which weighed over 16 oz., taken from a claim on New River.

Sold.—N. B. Wooley has sold his claim on the East Fork of Scott River.

Learned's Claim.—This claim paid week before last about $2,600; last week about $1,200.

TUOLUMNE COUNTY.

Big Strike.—Sonora *Independent*, Nov. 30: Plummer & Perry have struck a rich qnartz lode on Hiyahpoo Hill, about 400 ft. north of the Hiyahpoo Co.'s lode.

Kincaid Flat Co.—Sonora *Democrat* Nov. 30: This Co. are pushiug their tunnel rapidly. It is in 1,700 ft.

Nevada.

EUREKA DISTRICT.

Rich.—Eureka *Sentinel*, Nov. 27: The Ruby Cons. is turning out 4½ tons of bullion per day, valued at $465 per ton.

Silver Lick is looking and yielding better than ever before.

Suspended.—Work has been suspended in the mines of the Richmond Co., Ruby Hill.

ELY DISTRICT.

Bullion.—Ely *Record*. Nov. 24: For the week ending yesterday, the shipment amounted to $57,720.80.

Spring Mt. Tunnel has been extended inwardly 250 ft., and drifting is progressing. A contract for 50 ft. has just been let. In the breast a ledge has been struck which shows very promising. The ledge is about 2 ft. wide showing a fair quality of ore which assays over $100 per ton. Two ledges prior to the one last ent have been found in the tunnel. No. 1 ledge, abont 40 feet from the mouth, has been sunk upon 100 ft., and exhibits a largo body of vein matter not less than 10 or 12 ft. wide, and containing bnnches of ore which assay not lese than $75 to the ton. Ledge No. 2 is s small veiu struck about 165 ft. from tho mouth. It has been drifted upon about 40 ft. and shows a prominent vein.

Van Demark Tunnel.—The tunnel is in abont 350 ft. It is some 8 or 10 ft. wide and about 10 ft. high, and was locsted to tap the Tiger. It will strike the ledge some 300 ft. below tho surface. The tunnel passes over a blind ledge about 125 ft. from the cutrance.

Peavine.—The main shaft is down 175 ft. and sinking rapidly. On the 30-ft. level the drift west extends into the mountain 170 ft, showing a good body of ore the entire way. At the west end of this drift it is at least 120 ft. from the surface. The ledge is well defined. Ou the 80-ft. level the drift west extends in 160 ft. showing the same ledge. There are about 60 tons of ore ready for shipment, which will mill $120 per ton.

Silver Peak.—The main shaft is down 130 ft. and sinking rpidly. one shift being kept at work sinking, the other drifting and etoping. The ledge at the bottom of the shaft is 4 ft. wide, the ore looking splendid. We were shown 8 bars of fine bullion, each of which will reach 1,000 oz. There are about 150 tons of ore on dump.

Marion.—The main shaft is down 112 ft. showing a strong ledge of 2 to 4 ft. in width. The stopes are looking well and yielding good ore. A contract will soon be let for sinking the shaft 50 ft. fnrther.

Pioche.—Mr. Nelson is sinking an incline from the 460-ft. level, for the purpose of prospecting the mine; is down abont 100 ft. at an angle of 60 deg; at the depth of 130 ft. drifting will be commenced for the ledge. The ore boing taken out assays on an average of $475 per ton.

Arkansas—is looking well. On the 120-ft. level there is magnificent ore; the vein is well defined and from 2 to 4ft. wide. The 200-ft level shows the same kind of ore. There is about 130 tons of fine ore on dump.

Floral Mill.—The work is rapidly reaching completion.

Amador Tunnel.—The main shaft is down 70 ft. below the level of the tunnel. On the 50-ft. level they are drifting both ways, showing a well defined ledge.

Pacific Tunnel.—This tunnel is in 1,075 ft. near which point they have cut a ledge which proves good as far as inspected; is about 3 ft. wide with 18 inches of good pay ore.

Chief of the Hill—Is shipping from 4 fo 5 tons, per day, which averages $130, pulp assay. There has been shipped within the last 2 months bullion to the amount of $29.404. From the 12th to the 17th inst., 81 tons have been worked, producing $7,564.39. Winzes No. 2 and 3 are down 100 ft. at which depth the 3 winzes will be brought in connection on the ledge. The winzes are 100 ft. apart, all sunk iu ore. There are 35 men at work.

Huhn & Hunt.—They are sinking on both ledges; the shaft on the first or main ledge is down 130 ft. and on tho 2d about 50 ft.

Chief of the Hill—Eaet Ex.—The main shaft is down 160 ft and still sinkiug. At 200 ft. will commence drifting for the ledge; on the 90-ft. level they are drifting east. The ledge ie looking well, and Captain Hardy expects to find very rich ore on the 300-ft. level.

La Paz.—Shaft down 25 ft. A contract for sinking 100 ft. hss been made

Meadow Valley.—The most of the work is dead work or prospecting.

Portland East Ex.—Depth of shaft 68 ft. Working 2 shifts constantly. It is calculated that at a depth of 70 ft. a fine ledge will present itself.

Portland.—The ore continues to improve. There are 50 tons on dump.

HUMBOLDT COUNTY.

Dun Glen.—Unionville *Silver State*, Nov. 30: It is reported thst a rich etrike has been made in the Empire.

White Cloud Dist.—Rich and extensive deposits of copper ore have recently been discovered; 3 assays taken from the snrfaco of these deposits, yield respectfully 20, 22 and 26 per cent. of metal to the ton.

Rye Patch.—The Butte Co.'s mill is shut down.

Emily.—The Emily ledge is reported 4 or 5 ft. wide and full of mineral.

Trinity Dist.—Midian Torrey is prosecuting work on the Gov. Booth. The shaft on the ledge is over 100 ft. dcep. The ledge is 2 ft. wide at that depth.

REESE RIVER.

Belmont.—Reese River *Reveille*, Nov. 23: The Monitor mill started up Nov. 21st on its trial trip.

The El Dorado Co. are working to advantage on their mill.

The Belmont Co. have their hoisting works completed on the Canfield, and will soon put in the steam pump in the Highhridge, and erect hoisting works over the esme.

The Belmont Co. is coutinning its levels below water by contract, with favorable prospects, also taking out ore from upper workings.

The Monitor Co. is doing a great deal of work in their lower level through the new tunnel, preparing to tske out ore from the new mill. They have out slready assorted some 600 tons of first-class ore. Working 66 men.

The El Dorado Co. are pushing work on the El Dorado South and the Arizona. The ore houses of both are jammed full, and every available space on the dumps is piled up with spleudid ore. Over 500 tons are assorted and ready for the mill. The lower workings of the El Dorsdo never looked better thsn at present. The 350-ft. level going south ruus in splendid ore. The 400-ft. level runuing for this body is in 60 ft. and present the same characterics as the level above. Above the 240-ft. level a fine body of chloride has been opened this week. Working on mill snd mine 78 men.

The El Dorado North hss its vertical shaft down about 12 ft. The shaft is 4ft.6x8ft.6 inches.

Gold Mt.—The Oriental has a shaft down 112 ft.; the ledge at the bottom is 5 ft. wide.

The Independent has a shaft down 25 ft. with a ledge of an average width of 4 ft. of rich chloride ore, assays of which give an average of $500 per ton.

Ou the Austin ledge a shaft has been sunk 15 ft. revealing a well defined ledge of sulphuret ore, 5 ft. in width, and of an average assay value of $300 per ton.

The Borneo shaft has attained a depth of 25 ft. disclosing a uniform ledge 1 ft. thick, carryiug ore which averages $100 in silver and from $18 to $40 in gold.

WASHOE.

Chollar Potosi.—Gold Hill *News*, Nov. 30: Daily yield 130 tons, the assay value of which is $33 per ton. The 800-ft. station is about completed.

Woonville.—The uew hoisting works are to be started up at once. The main incline is down 156 ft. and this is to be retimbered forthwith. The first level is 75 ft from the surface, and the second or lowest level is, from the bottom of the incline, developing a fine vein of ore. The regular yield of 14 tons per day, of high grade ore, is from the tunnel.

Savage.—Daily yield, 150 tous worth $27 per ton. The ore hodies on both the upper and lower levels are holding out and improving. The incline is down 65 ft. below the 1600-ft. level. The north drift on the 1600-ft. level is making excellent headway. The south drift on the 1600-ft. level is making slow progress.

Seg. Rock Island.—Aa soon as arrangements are perfected the mine will be reopened aud put in full working operation.

Insurance.—The incline, at 55 ft., has broken through into an old chamber. Good developments may he looked for soon.

Hale & Norcnoss.—The work of prospecting the various levels is progressing. The yield is about 150 tons per day. Sinking the incline is resumed and is making good progress.

Silver Hill.—Both the north and south drifts on the first level are in quartz, the vein showing a regular and permanent formation.

Cons. Virginia.—Sinking the incline is making good headway, and prospecting at the 1167-ft. level going on as usual.

Sierra Nevada.—The mill and hoisting works were started up last Sunday. The different ore breasts in the upper and middle portions of the miue continue to yield 40 or 50 tons per day of good milling ore.

Imperial-Empire.—The work of sinking the incline ie making steady progress.

Buckeye.—The mill of the Co. is running steadily on ore from the mine, with excellent results. At both the upper and lower levels the ore body shows improvement.

Union Cons.—The main west tunnel is in 350 ft. The ledge at that point is about 100 ft. in width. A drift running northward along the line of the ledge is in about 20 ft. in solid quartz.

Baltimore Cons.—Shaft down 336 ft., making 16 ft. progress during the past week. The drift at the 250-ft. level is in 100 ft. from the shaft.

Crown Point.—The cross-cuts st the 1,300-ft. level hsve ehown hetter during the paet week. An immense body of fine ore is developing at that point. The ore breasts at the 1,200 aud 1,100-ft. levels are yielding splendidly.

Belcher.—Daily yield 300 tons. Good progress has been made in both drifts and iucliue during the week.

Gould & Curry.—Work was resumed yesterday.

Succor.—Shaft down 230 ft.; rock seamy, aud blasts badly.

Utah.—The hoisting works are idle for want of wood.

Jacon Little.—Assays from the upper mine during the past week, ran as high as $116 to the ton, gold and silver equally predominating.

Crown Point Ravine.—The shaft is cleaned out and repaired to a depth of 53 ft.

Overman.—The new and powerful hoisting engine is in place, new cages are being fitted in the shaft, and the snrface operations wear the appearauce of soon approaching completion.

Occidental.—The main north tunnel duriug the week cut a strong vein of quartz, tapping a heavy body of water.

Julia.—The msin east drift is driven ahead. Sinking the shaft is making good progress.

Red Jacket.—This mine has been yielding a finer quality of ore than heretofore, and the ledge iu the shaft is widening. The new tunnel is commenced.

Caledonia.—Considerable water is encountered in the lower drifts, somewhat impeding operations. The upper drift is in 618 ft.

Knickerbocker—Main west drift in 370 ft. Clay and qusrtz in face.

Senator.—Shaft down 207 ft. and making good progress.

WHITE PINE.

The Mines.—Schell Creek *Prospect*, Nov. 2: In Scheil Creek work on the McMahon is being pushed forward with vigor. The shaft is down 135 ft. below the croppings. Tunnel in 195 ft. in a slate formation, confirming the theory of a true contact veiu. The Ksvanagh tunnel is in about 120 ft. iu very hard qusrtz, which shows considerable mineral through it. In a ehort time the owners expect to strike a body of ore. Work on the Jupiter goes on, the mine continuing to improve. At Queen Springs work hss commenced on the Nutmeg. The intention is to sink a shaft some 75 ft. in depth, and prospect the mine generally. At Ruby Hill the Tambien is being worked steadily. The shaft is dowu 70 ft. During the week struck ore which assays $500 per ton.

Robinson.—The Canton Co.'s furnace is running steadily and tnrniug out considerable bullion. They made a fine run one day last week, turning out 105 bars of bullion in 24 hours, some of which assayed over $700 to the ton.

Bonnen.—The principal mines on Queen Spring Hill, were bonded this week to T. R. Posey, and another gentleman, for $75,000, the hond to expire on the 1st of May, 1873.

Arizona.

The Outlook.—Prescott *Miner*, Nov. 16: From Wallspi we learn that deep shafts are down upon several lodes, and that the ore is plentiful and rich. H. F. Baker is hard at work erecting his furnace.

The copper miners of Williams Fork are taking out and shipping ore to S. F.

Yuma Co. miners are taking ont ore from the Castle Dome mines, and shipping to S. F.

Las Planch de la Plata mines, on the line of Pima Co. and Sonora, are attracting attention. The lodes are small, but carry nearly pure silver.

Smith & Taylor are hard at work, setting their mill up, below Wickenburg.

Jackson & Co., are driving away at the Del Pasco.

Colorado.

Summit Co.—Colorado *Miner*, Nov. 21: Col. Fuller & Co., constructing a flume to carry the water of the Swan over a large extent of pay ground not yet broken, have completed 2½ miles and will finieh the rest next summer.

The New Englsnd lode is in a royal body of ore, worth by mill run, more than 600 ozs. in silver per ton. The pay vein, ahont 7 inches in width, is composed of solid argentiferous gslena.

Montana.

Ditch Enlargement.—Deer Lodge *Independent*, Nov. 23: It is in contemplation by the Rock Creek Co. to enlarge their ditch from the head of Squaw gulch to Pioneer City, to the capacity of 1,000 inches; also, to enlarge the Pike's Peak ditch to the head of Mormon gulch.

Unionville ann the Park.—The Addis mill is running on ore from the Park discovery; Judge Turnley's mill starts up Nov. 22d on ore from the Park lode; the Hodge mill is running on ore from the National Co's. mine. The Supt. reports proceeds of first month's run at $27,000, running day and night. Last two month's run working only half time has averaged $13,000 per month.

Big Bar on Flint.—The deep bar diggings on Flint Creek paid $15 per day to the hand during the past season.

Idaho.

Empire.—Silver City *Avalanch*, Nov. 23: More stoping ground ie being opeued every day. They are taking out daily 30 tous.

Minnesota.—The 4th level drift north is on s 20-inch vein of splendid ore, much better than ever found on the north side of the shaft. They have commenced hauling to the Cosmos mill.

South Mountain.—The furnsce is in full blsst turning out tons of bullion.

Wan Eagle.—The 5th level drift ie being driven north and south with dispatch. The vein is about 1 ft. in width snd the ore rich. They have jnet etruck a rich chimney of ore in the 5th level drift south.

Belle Peck.—The pay streak is from 5 to 18 inches in width.

Mahogany.—The 6th level winze 104 ft. south of the shaft, is down 10 ft. showing a ledge from 18 inches to 2 ft. in width, of amazingly rich ore. The 6th level drift south is in 136 ft., showing a ledge of about the same size snd quality of ore as in the winze. In the stopes, 25 ft. from the bottom of the 6th level, the ledge is sbout 4 ft. wide, showing native silver and free gold in abundance. They are stoping 40 ft. north of the ehaft in the 6th level, and tsking out fine looking ore.

Ellmore.—The shaft is down 80 ft. for the 9th level, and the winze, 64 ft. north of the shaft in the same level is down 54 ft., showing a ledge 2¼ ft. wide of first-class ore. They are etoping 150 ft. north of the shaft in the 8th level, with 75 ft. of hacks, in a ledge that averagee over 2 ft. in width of magnificent ore. In the 9th level, 200 ft. north of the shaft, they have struck the ssme kind of ore as found in the 7th and 8th levels. They will commence driving the 9th level by the first of next month, and at the same time begin sinking for the 10th level. In the 9th level we find the rich chimney in the winze, 64 ft. north of the shaft; in the 8th level the same chimuey is strnck 150 ft. north; in the 7th level it is fonnd 175 ft. north, snd in the 6th level it is discovered 200 ft. north. This rich chute or body of ore comes from the north, snd in all probability extends to the surface.

Utah.

Stockton.—Sslt Lake *Journal*, Nov. 27: The Silver Queen has a shaft 25 ft.; vein 4 ft.; ore valued at $45 per ton.

Grest Basin, shaft 25 ft.; tunnel 120 ft.; width of vein 3¼ ft.; good paying ore 18 inches; good walls.

Mandary, ehaft 120 ft,; 2 drifts 25 ft. each, showing good body of ore, well defined; working 3 men; abont 40 tons of ore on dump.

Ksthcrina—Shaft 25 ft.; some good ore on dump.

Our Fritz, shaft 22 ft.; looking well; ore, high grades of galena and carbonates.

Reamer looks well; deep shaft; some ore on dump of high galena and carbonates.

Tacson about 150 tons of ore on dump. They are taking out from 5 to 7 tons per day. The Tucson main tunnel is about 140 ft. rnu on the vein between walls; mineral from 10 to 18 inches of high grade; a shaft connects the tunnel 75 ft. deep.

Paul Pry shaft 100 ft.; vein 3 ft. at bottom, with 2 ft. of mineral; average about $55 per ton; a tunnel in 90 ft. is being driven to connect with the shaft, when about 10 men will be employed who can take out about 8 tons of ore per day; about 20 tons on dnmp.

Argent shaft is 120 ft.; vein 4 ft. at bottom.

Vulcan shaft 25 ft. looking well; about 25 tons of ore on dump. A tunnel will be started to connect with the shaft at a depth of 210 ft.

Minerva.—Has a vein of about 7 ft., well defined; good walls, solid and smooth, mineral mixed through with quartz; galena of high grade; some assayed as high as $295 in silver and 75 per cent. lead; shaft 100 ft., drift 40 ft.

Muscatine shaft 25 ft.; vein 3 ft.; 2 ft. ore, mostly carbonates; considerable amount of ore on dump.

American Fork.—The Wasatch King vein ie composed of argentiferous galeua, grey carbonate and black sulphurets. The discovery shaft has been worked to a depth of 40 ft., and shows a vein of solid mineral 18 inches wide. A tunnel has been opened on the vein below the discovery shaft, and worked 20 ft., showing a veiu of 12 inches of mineral. Abont 30 tons of ore have been mined and assay from $40 to $400 silver per ton, with 50 to 60 per cent. lead.

The Gold Seeker opened by a horizontal tunnel already worked 133 ft. has been bonded for 5 months; it is the intention to work this tunnel to a distance of 800 ft, where the indications are that a deposit of good ore exists.

Photography.—We have lately seen some specimens of Photography executed by Messrs. Bradley & Rulofson that eqnal or surpass any thing of the kind ever brought to our notice; we could name among others some of their photographs of Prof. Agassiz. The retouching and general finish together with their great clearness prove them the work of a thorough artist. Messrs. Bradley & Rulofson deserve great credit for their indomitable energy and perseverance. Their gallery has attached to it the only elevator in use in an art exhibition, and their artist—Max Bachert—is certainly a leader in his profession on this side of New York.

Diamonds.—An investigation is now going on to determine the authors of the "diamond frauds," and it is said that the guilty parties will be brought to justice, if it is possible to find out who they are. Arnold and Slack are considered as only the tools of the instigat—

The Mineral Hill Silver Mines.

The Mineral Hill silver mines did not turn out as well for the English company which bought them as was expected, and the whole concern came very near being wound up a ebort time ago. The profit made to the 31et of Decemher, 1871, was efficient to pay the dehenture intereet and redeem 30 honds, pay a small dividend on the share capital and leave a halance of £7,673 12s. 5d. to he carried forward. The working of the mines from Decemher to June was attended with loss, hut since then had resulted in a profit, and the reporte lately received by the company show a considerable increase in tbe returne. A meeting of tbe company was held in London, Octoher 30th, at wbich the Cbairman eaid it would be gratifying to the shareholders to know that the mine wae slightly thongh gradually improving. Two minee are now looking well, instead of only one, as some time ago. At one time the returns were only twenty tons per week, and hy last advices 64 tons were being raised. The proceedings of tbe meeting are fully reported in the *Mining World*. Captain Hoskin's monthly report wae read, hut as he did not point out how the company could be saved from being wound up it is of no particular interest. Mr. Henry Sewell, the well-known mining engineer, reported on this property at requeet of the company, and we give his report as well as that of the Directors, helow. We understand that Mr. Sewell made no charges for his professional examination of the property, heing probably incited hy a commendable desire to henefit hie countrymen and to eave tbe reputation of tbe property, ae well as that of tbe celebrated mining firm of John Taylor & Sons., of London. Mr. Taylor'e son had personally reported favorably on the property, and the firm held eharee in the company. Some distrust was manifested in their fairnees after the uufavorahle result of operations hecame evident, which Mr. Sewell'e report will probahly remove. Terms have heen agreed upon for a lease at a moderate royalty of the locations referred to by Mr. Sewell in his report, and immediate trials will he made there.

The Directors' Report.

In presenting their Annual Report the directors desire to inform the shareholders that tbe chairman, Sir C. T. Van Straubenzee, K. C. B., having been appointed Governor of Malta, has resigned his seat at the hoard; and that Col. Napier Sturt, M. P., and Mr. C. F. Clements have also eent in their rcsignatione. The vacancies in tbe board thus caused may be filled up or not, as the shareholders may decide. The accounts now preeented to the meeting are made up to 30th June last, and have been examined aud passed hy the auditors. Tbe profits made to 31st Decemher, 1871, were efficient to pay the debenture interest aud redeem 30 bonds, and pay a emall dividend on the share capital, and have a balance of £7.673 12s. 5d. to be carried forward. Tbe working of the minee from December to June wae attended witb lose, ae ehown by the published accounts; and, tberefore, the debenture interest had to be met out of the available funds of tbe company; but the working of the mines since that time hae resulted in a profit, and the reports lately received show a considerable increase in the returns. Tbe quantity of ore raised per week had towarde the end of May last fallen to 25 tone, and early in July was only 20 tone of 50 dol. ore, but has since gradually increased up to 50 tone of 70 dol. ore; and the Superintendent advises that this increased return is likely to he maintained for eome time. In consequence of the unfavorahle reports from the mines the directore called a meeting of the debenture-holdere, at whieh a committee was appointed, who made a careful investigation as to the formation and position of tbe company, and iesued a report which has since heen circulated among the debenture-holdere and shareholdere. In that report they recommended that further exploration of the Company'e property be carried on, and made suggestions as to the source from whence fnnds for thie purpose should he provided.

Your directore as well ae that committee have made etrong representatione to the vendors of the Mineral Hill property, in order to indnce them to return eome portion of the purchase-money, hut without enccess. A sum of £2,600 has, however, been received from the California Mining Company, Limited, as a loan, which furniehee the meane for carrying on present exploratione. Many of tbe debenture-holdere have intimated their deeire to forego the interest on their bonds, in order that theee explorations may be continued with vigour, to prove the value of the company'e property, and sufficient fnnds for that purpose would be available if the company were relieved from the necessity of making the heavy quarterly payments of interest. In conecquence of theee representationa the hoard has taken the advice of counsel, who is of opinion that tbis can he effected only by the reorganization of the company witb the sanction of tbe Court of Cbancery.

Mr. Sewell's Report.

"On *three* conecntive daya I inspected with great care the geological formation and topographical position of the above minee, and tbese two combined are the true "Key" as to tbe inexhaustibility, or *vice versa*, of the veins therein contained. Great errors are committed often by miniug experts giving their whole attention to the underground workings, neglecting to etudy the eurrounding country, its rocks, and tbeir effect on the mineral veins. By exploring tbe country rocks at surface, and in the immediate vicinity of the mines, and by forming in the mind's eye diagrams, sections, positions, and angles of inclination of such, substantial conclusions can he arrived at in conjunction with the underground inspection; for every variation in direction, extension of the veins, and tbe minerals therein contained can be traced to the adjacent rock; and the study and exploration of the rocks at surface, generally gives the expert an insight into the deeper rocke, thus assisting him to draw almost invariably safe conclusions as to the permancy of the veins and the ore contained in tbem. In the case of tbe Mineral Hill mines the causes and effects are most apparent, as can he seen by the accompanying cross-section of the hill. From *A* to *A*, is about 160 feet in thicknese of stratified contorted limestone; c, c, are fiseures in the limestone filled with quartz matrix which carriee the ore. These vary from 20 to 30 feet in width, and can be traced through the whole length, continuing for some distance heyond tbe mines of the Austin Company. Fissures in the limestone filled with quartz is the only matrix in which the ore is fonnd.

Theee vary from 20 to 30 feet in width, and can he traced through the wbole length of the mines of the English company; continuing for some distance heyoud the mines of the Austin Mining Company. On many places tbese fisanres have becn completely worked out; but there still remain some that will continue to

B

produce ore for several monthe. I see no certainty of theee fissures living heyond tbe limit of the limestone, as can be seen from the nature of the underlying rock at *B*, *B*, which is compoeed of soft shales. I have not found a trace of primitive rocke near these mines; theee no doubt exist, hut at a great depth, and therefore of no henefit to tbe surrounding rocks wbich produce the ore. While inspecting the surface of these mines I discovered a location which I consider of great importance from the class of ores at surface, hut little attention had beeu given to it, considering the ore to be lead, and of no value for the milis. The ore assays ahont 25 per cent. lead, and as high as 70 dols. in eilver. The deepest point in this location is 15 feet, without any horizontal worke or levels; in fact, thoronghly neglected iu consequence of tbe nature of its oree. I explained to Mr. Oakes and Captain Hoekins that ochry lead oree in many districte in Utah are the indicatione at eurface, which mincrs follow to reach rich milliug ores. On the whole of the property I have not seen anything that wonld indicate a great body of ore nearer at hand than in thie location. Tbe width of tbie ochry lead ore is ahout six to eeven feet, and contains ae far ae it has been worked, say 15 perpendicular feet. Then tbis body of lead oree is surrounded by the same quality of quartz that produce the ore all over the hill. I calculate tbis spot is likely to produce many tbousand tons, ae the width of quartz on each eide of it is not less than 50 feet. This location can be proved with about $5,000, and I therefore strongly urge the company to open it out. I also brought before the notice of Mr. Oakes the great importance of prospecting the surrounding mountains, especially a etratified limestone range, within four miles of Mineral Hill, for in the like formations have heen found our richest mines in Utah, sucb as Camp Floyd, Tintic, etc. Mr. Oakes informed me he had already sent out two men for a few days, at $4 per day wages; I pointed out to Mr. Oakes tbat wagea alone wonld uever stimulate American prospectors to do any real work, and requested him to make an arrangement for wages. and an interest of a fourth or tbird of the find, which generally they are only too glad to bargin for. I took with me an assistant, a man of great experience, Mr. Edward Taylor, an American wbo bae had 22 years practical experience over all tbe States and Territories of the West. He fully concure in the viewe I have taken. The management of this property is in excellent hande. In Mr. Oakes I found a gentleman of great probity and intelligence, with a zeal for tbe welfare of tbe company ouly to be found in men of high principlee. In Captain Hoskine I found an intelligent man in hie profeesion, who has managed his department with great ekill. In the metallurgical or milling section I found Mr. Eiszer a thorough, competant man. I augur very well with such a trio for the future welfare of this company, provided the programme I point out is carried out."

Large quantities of volcauic dust were ejected from Veeuvius during the recent eruption. A sample, collected at Ischia, about twenty-five miles from the mountains, was composed of quartz and magnetite without titaninm.

San Diego and San Bernardino Railroad.

A correspondent of the *Alta*, writing from Los Angeles, gives the following details concerning the Sau Diego and San Bernardino Railroad, upon whicb work hae just been commenced :

Just now, before entering upon the deecription of an interesting trip to the Valley of San Bernardino, it will be proper to say something relative to tbe preeent condition and financial prospects of tbe company which has undertaken the work.

The Original Plan

Was proposed ahout three years ago, under circnmstances peculiar to the time. Then, there was some douht as to the ultimate designs of the projectore of the Memphis and El Paso Railroad. It was helieved by many, that if built at all, it would be over a route from the Colorado River to San Francisco, by way of San Bernardino, leaving San Diego effectually "out in the cold." To guard against such a contingency, the idea of a branch road to run north from San Diego and tap the main trunk, was hroached to the citizens of San Diego by Judge George Hyde, of San Francisco. This gentleman had invested in real estate in the embryo city, and was consequently interested in its prosperity.

Shortly afterward the San Diego and San Bernardino Railroad Company wae organized and incorporated under the laws of tbe State hy residents of the counties in which it was designed to be constructed. Preliminery surveys were made, and the route was soon found to be not only practicahle, but to pass through and make tributary a large and exceedingly fertile country.

Suhsequently, the County of San Diego voted a subsidy of one hundred thousand dollars in aid of the enterprise, and San Bernardino County followed suit hy votiug fifty thousand dollars.

The Present Plan

Has not heen made to differ in respect to route hy the changed aspect of railroad movemente. The commencement of operations on the Texae and Pacific Railway, under the management of Colonel Thomae A. Scott, has stimulated tbose interested in the Company to renewed exertions in order that a moet important feeder may be provided for the new transcoutinental road, and tbat San Diego may be brought into connection with its most valuable and productive back country. The standard gauge has been adopted.

The line of the road runs north from San Diego, following the natural gradee offered by the face of the country, and meete witb no serious difficulties anywbere, excepting a little heavy work and a short tunnel between the San Luis Rey Valley and Temecula. Twenty miles from San Diego the country hegins to offer fine inducements to farmers, and rapidly improves towards San Bernardino. The last forty milee are almost entirely level, open country, rich iu eurrounding agricnltural and mineral resources. There are hundreds of thousands of acres of the finest tillable land, which only need fecilitiee for transportation prior to hecoming thickly settled hy enterprieing and prosperous farmers.

The length of the railroad by survey will be 112 miles, and it is estimated that it will require only the expenditure of $2,000,000 to construct it and furnish it with rolling stock.

The Condition of the Company

Has been variously and incorrectly reported, and it eeeme to be the desire of the present managers to correct popular exaggerations and to present their claims for eupport and assistance fairly and honestly.

First, they have their organization, preliminary eurveys, five milee located at the San Diego end, the rights of way over private property nearly complete. Eigbt acree on the bay of San Diego, adjoining to the north the lands selected for the Texae Pacific Railroad, have been condemned and the titles to tbe land have been partially acquired. At San Bernardino adequate depot grounds have been promised by the people there, and will soon he the property of the Company. The money realized from the disposition of a limited amount of stock and the subsidies of $150,000 contingent on tbe completiou of the road, complete the list of assets.

Tbe Company is entirely out of debt, and is endcavoring to proceed with its work as rapidly as its circumstances will permit.

The Work.

It was some time ago incorrectly reported that a contract had heen concluded for tbe construction of tbe first ten miles of the road. Negotiations were pending in tbat direction, but owing to the failure of the contracting party to furnish satisfactory guarantees of his ability to proceed to a snccessful iesue, the whole matter was dropped. It is now tbe intention of the Company to construct the firet five miles, which they must do within one year, to preserve their franchise, without contract. To do this hut little grading is necessary, all of which can easily be done by the officers of the Company.

Grading has been commenced with the funds obtained from those who have subscribed to the stock. This they propose to continne doing, commencing at both ends, and without contracting debts. If present prospects continue favorahle, they will be able to do ao. The people at both euds appear to be united in their good will to the Company, and aubecriptions for stock are constantly heing received.

As soon aa the grading is done and tiea furnished, it is expected that little difficulty will be experienced in obtaining the funde to lay the iron and provide the rolling stock.

The popular opinion ie tbat this road will become an important link hetween the Texae and Pacific and tbe Southern Pacific of California, and tbat it will also become the concluding portion of a road eventually to be constructed from Salt Lake to San Diego. Inquiry has, however, developed the fact that the Directora of the Company and Stockholdere, instead of trying to occnpy a valuahle route for the eake of heing bought off, or in order to get in the way of others, as has sometimee been hinted, are solely anxious to have the road constructed, and are laboring to induce capitaliste to see its importance. They are confident that their own means, invested in the enterprise, will not be thrown away, even though other parties may hereafter control it.

It is possible that the first forty or fifty miles of the route north of San Diego may be necessary for the use of tho Texas and Pacific, the Sau Diego and Los Angeles and the San Bernardino Roads. If surveys now under way prove this to he a fact, the nltimate construction of the road may be much hastened.

It is to he hoped that no other company will attempt to run these parties off the track, inasmuch ae they appear to be willing to enter into any arrangement for the use and the construction of their road that may he just and advantageous to the public interest.

There is, therefore, little doubt in the minde of the people but that the enterprise will succeed, striking, as it does, into tbe very heart of the country that is now to receive such an impetue from rival railroad efforts. From an outside point of view, it looks apparent that either Colonel Scott or Governor Stanford will eventually squeeze thie plum into their own pockets. In either case, the Company will not have worked in vain, as regards their private local interests.

Sacramento Earthenware.

In the city of Stockholm, the capital of Sweden, four years ago, the attention of the Bergman Brothere, practical and chemical potters, now proprietore of the Sacramento Pottery, in the vicinity of Sutter Fort, was drawn to a eample of California clay, exhibited in a cabinet designed for scientific purposes. So forcibly were they impressed with the value of California clay, they at once took passago for the El Dorado of the West. On reaching San Francisco the hrothere, ascertaining on inquiry that the hest clay lay in the vicinity of Sacramento, at once procceded thitber. They purchased an interest in the Sac rementa Pottery, of which they are now the sole proprietors. The utmost succese has attended their efforts, and Sacramento earthenware hae a world-wide reputation ae being superior to all others. The Bergman Brothere have heen so successful in hueiness that they sent to Europe for their father, mother, two brothers and a eister, all of whom arrived here about a month ago. The Bergman *pere* is in the prime of life, heing hut fifty-two years of age, and has a moet thorough knowledge of tbe qualifications of various kinds of clay. The old gentleman is delighted with California, especially Sacramento, and has hecome satisfied tbat for pottery and brick husinese California clay ie not excelled. During tho past two months there have heen hurnt at tbe Sacramento Pottery 2,000 gallons of etoneware. The proprietors are preparing for the manufacture of terra cotta and Rockingham and yellow-ware.

The reeult of a late prospecting tour was that they found in this county, ahont forty milee distant from the city, an excellent article of clay. In a ehort time the father and his two sone will start out on another proepecting tour, traverein the State from one end to tbe other, in eearch of a still hetter quality of clay, which tbey are eatisfied California posseeeee. Ae California clay is mixed more or lees with mineral, it requiree more manipulation than European clay; hnt when the foreign elemente are expunged it cannot he excelled. The Bergman Brothere have written to Sweden for two experienced pottere, and it is tbeir intention next eeaeon to enlarge their pottery to three times its preeent capacity. Tbe firm has no agency here or in San Francisco, there being no need of any, as the wares are sold as fast as tbey come out of the kiln. About two montbs ago there arrived from the East two car loads of earthenware, which the consignee eaid he had no use for, as Sacramento eupplied a mnch superior article.—*Sacramento Union.*

Stranoe if True.—In Oroville, a few days since, says the Marysville *Defender*, a white man and a Chinaman entered the tunnel of a mining claim to begin their day'e work. The tunnel was into the hill about 50 feet, and the men had heen to work in it eteadily since its commencement. The nsual time for the return of the Chinaman with the dirt having passed, those on the outside entered the tunnel and found them both dead. The miner was sitting on tbe whellharrow, his head on his hand, while the Chinaman was lying on tbe floor of the tunnel. The candle waa still burning, which adds to the mystery regarding their deaths. Had foul air been in tbe tunnel, the candle would have been extinguished.

Useful Information.

The Manufacture of Tea Trays in the United States.

It is only nntil rcecntly that the mannfactnre of japanned tea trays has been made a practical snccess in this country. It appears that there were two difficult objects to be secured: first, a finish that would retain its gloss; second, a sheet-iron eqnal in quality to the Russia sheet-iron. Even the English tray, in some instances, after exposnre to the atmosphere, has a blue caste—termed a bloom; and after thie change, will readily scratch. The Newark Tea Tray Company, however, now present a tray, the perfection of which is duo to Mr. Walter M. Conger, the inventor of an improved process for manufacturing and finishing these goods. Mr. C. is also manager of this company.

The iron used hy the company is made expressly for them by a Pittsburgh (Pa) iron firm, and the grade of this iron, it is said, is better than that nsed in the making of the English trays. In producing a tray the iron is cut in oval shape by means of a pair of circular shears, in the style and size required, from 10 to 28 inches in length. It is then placed under a large stamping prese; (three or four plates may he placed under this press at the eame time.) The drop-hammer of thie machine weighs 1,000 pounds, and in its fall is capable of giving a prossure of 36,000 pounds. The plates are now blank trays, the edges of which are turned down and wired by a very ingenious little machine. Each tray is then set. This is done hy hammering by hand, to take out any unsveuness that may exist in the metal. After this the trays are cleaned, and, if found free from defects, are ready to receive three coats of Japanning, and placed in an oven for twelve hours with a temperature of 500° F.

After coming from this oven they are rubbed down with pumice-stone and circular brushes run by steam-power, then ground; the last is a secret process. After thie the tray receives a coat of enamel composition. The utmost care is used in this process; the windows and doors of the apartment are kept closed; the floor immersed in water; the workmen not even permitted to wear any clothee, as the smallest speck of dust or lint would spoil the labor previously expended, and greatly depreciate the valne of the tray. The enamelling being completed, the tray is sent to another department for ornamentation. This work, though done mostly by boys, is a very tasteful operation. The tray is then baked about twelve hours, when it receives a coat of varnish over the ornamental edge only, to retain the ornamental designs, and baked again; this last process perfecting them for the storeroom, where each tray is examined, and those not up to the standard are rejected. They are then packed in paper bags, numbered and marked, and are ready for sale.

How Paper Stood the Fire in Boston.

Curious results have followed some of the experiments made upon charred papers and documents, and the examination of books in safes which proved worthless in the great fire. It has been found that what psper-makers call poor paper, paper considerably "clayed" stood the best test. Parchment paper, used for bonds and legal documents, shrivelled up exceedingly, and the print blistered so that it could he read when the writing was illegible. So it was with the engraved work on notes. The gilding on the account-books burnt and charred showed out as bright and clear as when the books were new, which brings up the question if to introduce gilt-edged account-books would not be well, on the ground that the gilt would stay the passage by fire to the pages within. Books crammed into a safe so that it was difficult to get them out, suffered considerably less than those that were set in loosely, and in some cases came out from safes in which everything else was worthless, so far preserved that the figures on the pages could be deciphered. With charred papers which could not be made transparent by any light whatever used, it was found, after the employment of vitriol, oxalic acid, chalk, glycerine, and other things, that anything that moistened them to a certain stage—to which it was delicate work to get and not pass—made the lines, words and figures legible through a magnifying glass. It has been the almost universal experience that the led-pencil marks show out all right when ink marks cannot be distinguished. The success of the use of photography has already been noted.—*Boston Advertiser.*

How to Detect Spurious Greenbacks.—An exchange gives the following: To discover spurious greenbacks or national bank notes, divide the last two figures of the number of the bill by four, and if one remains the letter of the genuine will be A; if two remain it will be B; if three, C; and should there be no remainder, the letter will he D. For example, a note is registered 2,461; divide sixty-one by four and you will have one remaining. According to the rule the letter on the note will be A. In case the rule fails, be certain that the bill is counterfeit.

Testing Wine, Beer and Vinegar.

Duclaux, briefly describing a system of testing the relative value of the liquids referred to, states that, when alcholic or acetic liquids are caused to pass drop by drop from a narrow orifice, these drops are heavier in relation to the larger quantity of alchol or acetic acid contained in the liquid under examination. Special apparatus are to be used for this method of testing.

The ordinary tests of wines are two kinds—the alcoholometer and tasting. The first is to prove how much alcohol the wine contains, and is based on the knowledge of the specific weights of absolute alcohol and water. Suppose a little glass is full from 1,000 grains of water, the same would get full from 792 grains of alcohol—it is one-fifth lighter than alcohol, and its resistance is immeasely less. For the purpose now of ascertaining the strength of wine, an instrument has been invented; it is a glass cylindor which, at the bottom end, is ball-shaped, containing mercury. The cylinder is marked off into 100 parts called grades. Now, if you sink the cylinder in a mixture of ten parts alcohol and ninety parts water, the liquid will reach the 10 grade, which shows that it contains 10 deg. of alcohol.

The other test is hy taste; the knowledge of which can only be acquired by time and experience. Suppose your judgment is required as to a wine; if it is Madeira, it would he necessary that you had tried the genuine Madeira, before and became, through taste and smell, fully acquainted with all its characteristics. So it is with all other wines.

Masonic Symbols as Trade-Marks.

Upon an appeal from the decision of the Examiner of Trade-Marks, Active Commissioner Thatcher has given a highly interesting decision in a case involving the use of Masonic symbole as a trade-mark:

He decides that, in view of the universality of Masonry, the mystic tie that binds all nations in one common fraternity, and the unchangeable characteristicts of emblems appealing with the same force to the brotherhood in all parts of the earth, it is impossible to divest these symbols, or at least this particular symbol, perhaps the best known of all, of its ordinary signification wherever displayed, either as an arbitrary character or otherwise. It will be universally understood or misunderstood as having a Masonic significance, therefore as a trade-mark must constantly work deception.

The Commissiouer adds: "I am clearly of the opinion, therefore, that the proposed combinations cannot properly subserve the ends of a trade-mark. Among Masons, with whom this token has a moral significance, its use in that capacity would undoubtedly be regarded as a base prostitution of it to mercenary purposes, while with others its mystic force would often dissipate its virtues as a trade-mark, and, perhaps, in some instances, place the article it appeared upon under a ban.

"Thus, if these trade-marks could be sanctioned they would tend to defeat the fundamental object of the trade-mark law, which is an offshoot of the ancient 'law merchant' and like that, designed to advance trade and manufactures."

For the above reasone the Commissioner decides that the Examiner of Trade-Marks was correct in his refusal to grant any exclusive use of any Masonic emblem as a trade-mark.

Separating Hair from Skins.—Some months since our attention was called to an English patent process which is in itself a matter of no small curiosity to tanners, and which promises to make very great changes in the future of the fur business. The patent is for a process for completely removing the hair from a hide or skin and transferring it exactly as it left the hide or skin to a piece of muslin or other substance, leaving the pelt entirely uninjured for future tanning and finishing into leather. The process is a very simple one; the operation is as quickly performed as ordinary unhairing with lime, and with no more expense.

Mr. Charles H. Isham, of New York, who has just returned from Europe, saw the artificial skins made by this process at the store of the patentees in London, and brought several specimens over with him, as well as figures showing the cost of making them and the prices at which they sell. He also visited their workshop, and saw that the work could be done very quickly and at a low cost, as claimed by the patentees.

Arsenic in Carpets.—Hallwachs asserts that not only green but red carpets contain arsenic, particularly those brilliant dark reds now so much in vogue. Samples of these carpets burned with the blue arsenic flame, gave off the characteristic garlic odor. Enough color to give a distinct arsenic reaction could be rubbed off with the finger. A solution in hydrochloric acid produced with copper the usual greyish precipitate of metallic arsenic.

Removal of Ink Spots.—When these are of long standing it is difficult to get them out, since the iron has become thoroughly peroxidized and must be reduced. The following is recommended:—Water ½ litre, hydrochloric acid 100 grms, tin salt 100 grms. Moisten the spot with this solution, keeping it moist until the color disappears, then rinse with water.

Good Health.

The Modern Idea of Disease.

In an address before the Clinical Society of London, Sir William Gull remarks as follows on the modern idea of the nature of disease:—

Respecting the object we work for—this living organism of ours—one great advance has of late been made. We are acquiring a physiological notion of disease. Disease is no entity; it is but a modification of health—a perverted physiological process; and this must at all times be insisted upon. Were it not that we fear death, and dislike pain we should not look upon disease as anything abnormal in the life-process, but to be as part and parcel of it.

Few would now venture on a definition of disease; for in reality it is but the course of nature in a living thing which is not health. In health the balance of function is even; incline it to either side and there is disease. That being so, just as the life process constitutes an individual and puts him apart from his fellows, so must any alteration in it be individual, and not general. But to the ignorant, disease is an entity—an evil spirit which attacks us and seizes us. Hence arises the word "seizure," which, though in a somewhat different way, we still use, but with a protest. To the charlatan, disease is a set of symptoms to be attacked by a variety of drugs—a drug for each symptom. To us, disease is a life-process of a perverted kind.

Many states are not now called diseases which used to be, and there are still some to be expunged. Some people are always ailing. Some have feeble stability, and to them it as natural to be ill as it is to others to be well; but this is not disease. So, too, aged persons get ill; but this is not disease—in reality it is natural change simulating disease, and when we try to cure such we see all the farrago of the chemist's shop to prevent the sun setting. So syphilis at last ceases in the system to be syphilis, and becomes an early decay.

It is curious to consider the various morbific agents at work within our bodies, the lines in which they work, and their seats of action. These as yet have been but little studied, and deserve attention. Thus, it is very doubtful if scarlatina begins in the blood, as we should all be apt to say, rather than in any other tissue or fluid. Let it be our object to find out where all these begin within the body, and how they enter the body.

In future, I hope, comparative pathology, which is just beginning to be studied, will teach us much; for in our bodies we men have many organs which are of little or no use to us, and are only relics of a former state of being. What, for instance, is the comparative anatomy of the tonsils? Were I to make a man, I do not think I would put tonsils in him. Yet these, and such like organs, in accordance with the general law, are more prone to disease than are the others which are of real use in the system.

I remember the case of a man who had a permanent vitelline duct. He had been out on a cold day, and the motion of the intestines twisted them in a mass round his persistent duct, and he died. I made a preparation of the duct, and wrote under it, "Cui vitam atque mortem dedit diverticulum." Every part of the body is alive, and has its own individual life and pathology, whether it be immediately required or not; only, if not required, it is more prone to disease than if it were. I could for instance, suppose a fœtus of four months going to the doctor and saying, "I am going all wrong; my Wolffian bodies are disappearing, and kidneys are coming in their stead." Yet that is as much a condition of disease as some of those conditions of which I speak.

Education and Health.—It is impossible that the mass of men can be healthy, and so moral and successful, without some knowledge of their structure, and of its laws, which they must obey or suffer. How can a young woman be called educated who is ignorant of physiology, of her duties as a mother, of the divine art of nursing? How many men know anything of the relations of waste and supply in the nervous economy? Why, not one man in a hundred knows even what the stomach is made for, and the other ninety-nine are constantly transgressing rules they have never learned. We may take the old parable of the apple in the garden as an illustration of the way men's stomachs make havoc with their moral sense. Not one man in a hundred knows or suspects that God made the air to be breathed. Every part of his house may be reeking with miasma, the cellar full of all evil, partitions clotted with dormant mischief, and he never dreams of it, but goes on nailing down his windows and listing his doors. If we could only see the air we have once breathed over! Even the architects of our public halls and theatres and churches have the crudest notions of ventilation.—*Henry Ward Beecher.*

Saliva a Cure for Rheumatism.—Some one writes to the editor of the *Medical Press and Circular* that he has repeatedly cured himself of rheumatism by rubbing the affected part with his own saliva. As saliva is too common to become an article of traffic, the new treatment is not likely to become popular.—*Pac. Med. Jour.*

To remove plaster of paris bandages, wet them with a strong solution of common salt.

To Sleep Soundly.

With many the inability to sleep, as a growing habit, is the first step toward certain madness; in every disease it is an omen of ill. Hence, to cultivate sound sleep, do not sleep a moment in the day time; go to bed at a regular hour, and never take a "second nap" after waking of yourself in the morning. Take nothing after dinner but a piece of bread and butter and one cup of hot drink—*not* China tea, as it makes many wakeful. Never go to bed with cold feet. Read nothing after supper, listen to nothing, talk about nothing of a very exciting character; avoid carefully every domestic unpleasantness, as to child, servant, husband and wife. Let no angry word be spoken or thought harbored for a single instant after teatime, for death may come before the morning light. Grown persons generally require about seven hours sleep in summer, and eight in winter. Few indeed, except invalids, will fail to sleep well who go to bed at a regular early hour, on a light supper, in a large room, and clean, comfortable bed, if there is no sleeping in the day-time, and not more than seven hours in any twenty-four are passed in bed. One week's faithful trial will prove this. Children, and all persons at school should take all the the sleep they can get, and should never be waked up in the morning after having gone to bed at a regular early hour. Every humane parent will make it a religious duty to arrange that every child shall go to bed in an affectionate, loving and glad spirit. If wakeful during the night, get up, draw on the stockings, throw the bed-cover to air it, walk the floor in your night gown, with the mouth closed all the while rubbing the skin briskly with both hands, until cooled off and a little tired. Except from August first to October first, in fever and ague localities, a chamber window should be open two or three inches in length.

The Unwearied Action of the Heart.

The effect of everything that touches the heart is multiplied by the intensity of the heart's own changes. Hence it is that it is so sensitive, so true an index of the body's state. Hence, also, it is that it never wearies. Let me remind you of the work done by our hearts in a day. A man's total outward work, his whole effect upon the world in twenty-four hours, has been reckoned about 350-foot tons. That may be taken as a good "hard day's work." During the same time the heart has been working at the rate of 120-foot tons. That is to say, if all the pulses of a day and night could be concentrated into one great throb, that throb would be enough to raise a ton of iron 120 feet into the air. And yet the heart is never weary. Many of us are tired after but feeble labors; few of us can hold a poker out at arm's length without after a few minutes dropping it. But a healthy heart, and many an unsound heart too—though sometimes you can tell in the evening by its stroke that it has been thrown off its balance by the turmoils and worries of life—goes on beating through the night when we are asleep, and when we wake in the morning we find it at work, fresh as though it had only just begun to beat. It does this because upon every stroke of work there follows a period, a brief but real period of rest; because the next stroke of which comes is not the natural suspense of that reet, and made to match it; because, in fact, each beat is in force, in scope, in character, in everything, the simple expression of the heart's own energy and state.—*Appleton's Journal.*

Endemic Dysentery in San Joaquin Co.—Dr. F. W. Todd, of Stockton, at the request of the Board of Health of that city, has drawn up an account of an epidemic of dysenteric disease, which has prevailed in Stockton and the adjoining country for the last three years. The report commences with a sketch of the topography of the country, its climate, water supply, etc. During the four months, from May to August, 1872, 251 cases are noted, with thirty-three deaths, and this does not include the practice of a number of physicians, from whom no returns could be obtained. Of the deaths, 25 were children, and eight adults, the latter mostly from the Insane Asylum. Dr. Todd inclines to attribute the disease to the great transition of temperature from day to day — no other cause being assignable. The best treatment consisted in large doses of ipecacuanha, from five to twenty grains. The paper is considered by the *Pacific Medical Journal* as very important and interesting.

Extreme Climatic Heat.—It is stated that owing to the extreme heat of the weather (120° F.) it was found necessary to bury the body of the late Professor Parrish on the day of his death. This was at Fort Sill, in the southwestern part of the Indian Territory. Many persons on this coast believe the climate of Arizona, near the head of the Gulf of California, to be the hottest in the United States, though the point above named, 120°, is the highest ever claimed for that locality. We can seldom rely, however, on the entire accuracy of the statements made in regard to extreme heat, as so much depends on the situation or exposure of the thermometer, and so few observers use proper precautions in this respect.—*Pac. Med. Jour.*

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

Table of Contents.

GENERAL EDITORIALS.—Mining Machinery, 360. Academy of Sciences, 364. The New Code Corporation Assessment Law, 361. ILLUSTRATIONS.—Steven's Furnace for Economizing Fuel, 353. The Stanton Ruby; The Late Horace Greeley; Boesoh's Reflecting Lantern, 360. Goat Island, 361.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, and Utah; Market Reports, 364.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 356.

MECHANICAL PROGRESS.—Testing Steam Bellers—An excellent Suggestion; Recording Sounds, Etc; New Methods of Stopping Leaks; American versus Foreign Leather Belting; Persevering Inventors; Statistics of the U. S. Iron Industry, 355.

SCIENTIFIC PROGRESS.—The Field of Knowledge; Variations in Spectrum Analysis; Crystallization; A New Fact with Regard to the Solar Corona; Action of Light upon Glass; A Tidal Watch; Possible Connection Between Cyclones and Sun Spots; Temperatnre of the Moon's Surface, 355.

USEFUL INFORMATION.—The Manufacture of Tea Trays in the United States; How Paper Stood the Fire in Boston; How to Detect Spurious Greenbacks; Testing Wine, Beer and Vinegar; Masonic Symbols as Trade-Marks; Separating Hair from Skins, 359.

GOOD HEALTH.—The Modern Idea of Disease; Education and Health; To Sleep Soundly; The Unwearied Action of the Heart; Endemic Dysentery in San Joaqnin County; Extreme Climatic Heat, 359.

MISCELLANEOUS.—Mineral Resources of Northwestern California: San Bernardino Couuty Mines; Indian Relics and Remains; New Mining Operation; Quicksilver Deposits—Are there any in Nevada; Nevada and Arizona, 354. San Diego and San Bernardino Railroad; Sacramento Earthenware; Strange if True, 359. Mining Assessment Law from the New Code; The New Oil Wells on the Ojai—Their Appearance and Prospect; Qneer Freak in a Mine, 362. Patents and Inventions; Notices of Recent Patents; Commission's Decisions; New Incorporstions, 364.

JAPANEGE PROGRESS.—A railroad abont 30 milee long ie now in operation bstwsen Yokohama and Yeddo, Japan. No donbt aftsr the Japaneee havs seen the practical working of thie most esssntial aid to civilization, the other parts of the country will want roads also. A beginning hae been made and we may now look to ees the country covered with railroade, and even gréater interest taken in machinsry of all kinds than heretofore. All thsse thinge augur well not only for Japan, but for the future of this Coast, since from hsre, no doubt, will the large proportion of hsr machinery bs sent. Some of tbe city foundries have already been sanding certain classes of machinsry to Japan, wbich will no doubt causs more to be ordersd.

AN ACT OF JUSTICE.—George D. Roberts and Henry Janin, who considered that it was through their recommsudation and influence that General J. W. Gashwilsr invested $40,000 in the diamond enterpriss, have returned to the latter gentleman $20,000 each to reimburse him for hie loss. Acts of thie kind so eeldom occur, that they are worthy of remembrance and comment.

MINING SALES.—According to the Jackeou *Dispatch*, the Downs mine, near Sutter Creek, hae been sold to Morgan & Co., for $400,000.

The Nevada county *Transcript* epeake of great activity in the tranefer of gravel mining property in tbat county, and thinks it is probable that $20,000 worth of property hae been transferred within 20 days. Good claims find ready market at good pricee, and there ie a growing confidence among capitalists in gravel mines.

EX-GOV. H. H. HAIGHT has been elected to fill the vacancy caused by the death of the Hon. Edward Tompkins in the Board of Regente of the California University.

A STOCK Board ie to be started in Grass Valley.

A NATION'S LOSS.

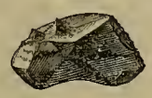
THE LATE HORACE CREELEY.

When our great and good men die, it is not unbscoming in us as a psople to grisve. Iu the recent death of HORACE GREELEY we lose one of the most noted men the nation has ever known. In the wide field of his varied usefulness, as a journalist, he etood in the front rank, for he had no equal. As a philsnthropist, he was lsrge-heartsd and possesssd of a noble courage. In his opinions, geuerally right, and in support of them, firm as adamant.

As an orator, patriot, statesman and politician, hs was earnest snd ambitious. As an agriculturist, his name will be remembered and honored. In his domsstic and social relations, ae kindly and genial as humanity permits; whilst not a shade of intsntional wrong has ever marred the fair fame of his great efforts for the public good, and in the lifting-up aud alleviation of suffering humanity. Aud now, after a lengthened, honorsd, earnest and eventful life, he sleeps, and the nation mourns.

The Stanton Ruby(?)

Through the kindness of Mr. Tucker we are snabled to present a natural sized cut of ihs famous $250,000 ruby(?) which Mr. Stanton brought from the diamond fislds of Colorado, a short time since. Its sizs and shaps, thongh somewhat irregular, is that of a small pigeon's egg and its color is amethystic blood red. After the sxpose of tbe diamond fraud, people who had firmly believed in ths value of this gem, hegan to bavs some doubts concsrning it. It was accordingly ssnt to be tested so as to settle the question. Mr. Stauton has iu his poesessiou a number of otber stones from the sams locality from which this one was obtained, in



tbe interest of the New York and San Francisco Diamond Company. The Denver *News* statsd that the gem weighed 16 carats, but its weight eeems visibly to have increased, since it is uow reported as weigbing 22 1-5.

Mr. Henry G. Hanks mads a partial examination of ths gsm this wsek and prouounced it a "spinelle," being without doubt of considerable intrinsic valus, but not posseseing the specific gravity or hardness of a ruby. Neither has it the electrical propsrtiee of a ruby. It was easily scratchsd with a sapphire.

Below we give some additional features from the report of Mr. J. S. Phillips on this gem.

It weighed 22 1-5 carats. Its specific gravity is 3.703. No feature of its crystallization can he now recognized. It is not so hard as the Ruby or any other stone of the Sapphire family, but its lustrous conchoidal fractures, still unworn hy attrition, are noteworthy characteristics, not only of sufficient heauty and hardness for perfect polish, hut of the uncrystallized, irregular granular form which the Pyrope almost invarlably possesses.

It has not beeu tested hy fire, or analyzed in any way, for fear of serious fracture, and detrimental change of color; hut the following specific gravities will serve to show that it comes near to the Splnelle Ruhy, Almandine, and Pyrope. Oriental Ruhy 4.284, Balas Ruhy 3.646, Brazilian Ruhy 3.531, Spinelle Ruhy 3.525 to 3.76, Common Spinelle, maximum, 3.585, Almandine 3.5 to 4.3, and Pyrope from 3.69 to 3.8. The qualitative examination of a similar, 2 grains, stone, hy hlowpipe, exposed the following elements and facts. When heated it failed to produce the peculiar green, as the Ruhy, hut on slowly cooling from hright red heat, it hecame almost hlack, and when quite cold resumed its original color.

A small piece was fused on naked charcoal, in the hlowpipe's flame, to a brilliant glasslike hlack globe which attracted the magnet.

The Rubies and Spinelles cannot be thus altered.

It contained Silica, Alumina, Magnesia, Iron, Manganese, and Chromic acid, which exactly agrees with Pyrope, and excepting the last (Chromic acid) with Almandine.

I am therefore of the opinion that these precious stones are Pyrope and Almandine, otherwise known as Ancient Hyacinths and Carhuncles, or the Precious Bohemian Garnet, Garnet Ruhy, &c., which are "much esteemed as precious stones."

J. S. PHILLIPS, M. E.

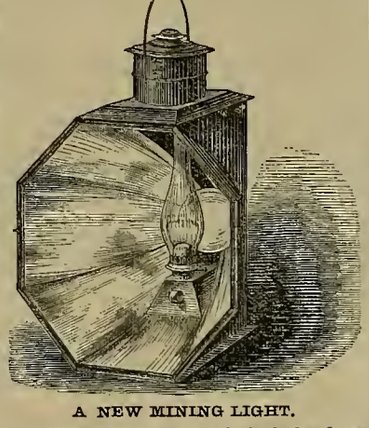
So aftsr all it is not a ruby, but appears to havs value ae a favorite gsm, for it has fins lustre and color, as well as sufficient solidity and hardness to admit of being highly polishsd by the lapidary.

Boesch's Reflecting Lantern.

By ths economy of nature our earth is covered with darkness one-half of tbe time, and were it not for the benefits which we derive from artificial lights, a large portion of our sxistence would be passed in a most unprofitabls and unpleasant manner. But tbanks to ths scientific and inventive world which have so thoroughly ovsrcome the darkness as to permit ths night, iu a great measure, to be turned into day.

Although ths facilities for lighting our dwellings, our strests aud our ordinary places of businsss and pleasurs are and have bsen abundant and cheap for yeare, yet we have never had a light such as would be suitabls for lighting up a large area with a single burner without entailing a largs expeuee for its maintainencs. This want was particularly felt in our hydraulic minss where it ie necessary to light np large and high banks during the night to enable the miner to dirsct the hydraulic stream effectively against it. Mr. Emil Boesch, of tbis city, knowing that such a light was required hae invented and sscnred lstters patent through the MINING AND SOIENTIFIC PRESS Patent Agsncy for the improvement represented by the accompanying cut.

The chief advantages of tbis lamp are first, the employment of an ordinary coal oil or other burner for giving the light; sscondly, in providing an abundant ventilation at the bottom,



A NEW MINING LIGHT.

top and rear so as to properly feed the flame with air and prevent ths interior of ths lamp from becoming eo hot as to break the glaes front; thirdly, in the employment of a focal reflector which can bs adjueted up or down or to either side according to the directiou in which it is desired to concsutrate the light, and fourtbly, in constructing the entire lamp in a couvenient portable form eo that it can bs moved from place to place readily when rsquired.

This lamp is mechanically eoustructed and is admirably adapted for lighting np mines, mills, halls, wharves and other opeu spaces. The inventor, Mr. Emil Boesch, is a practical lamp manufacturer, and is proprietor of ths large lamp factory on tbe corner of Pacific and Kearny streets, in this city. This, we believs, is tbe ouly lamp factory on tbis Coast. Mr. Boeech has procured a uumber of patents for improvements ou lampe, lanterns and reflectors within the past few years, through our Patent Agency, and has met with united succees as a pioneer in his business. The lamp represented by the engraving is meeting with a fair sale, and is giving much satisfaction. For furtber particnlars address Emil Boesch, N. W. corner Kearny and Pacific streets, this city.

PERSONAL.—We received a visit this week from Mr. J. A. Johnson, editor and proprietor of the Santa Barbara *Press*, one of our best interior exchanges. The *Press* represents in an able manner the iuterests of Sontbern California, and is a source of reliable information concerning the locality iu which it is published, as well as being very interesting on geueral topics.

THE DIAMONH SWINDLE looke worse and worse. We will give the chiefs their due wheu the investigation determines who are the guilty ones.

Mining Machinery.

In some parts of England it seems difficult to introduce nsw mining machinsry, the objectious heing only born of prejudice, not ignorancs, for the mining prsss of that country are very diligent in bringing before thsir readsrs improvemsnts in the appliances connected with the bueiness; and judging from the exhaustive reports in the papers, in vsry small type, and the correspondence called out by such reports, the miners and mining men support and read tbe papere which support their intersste in a very thorough manner. It is acknowledged that in some respects progress is slower in Cornwall than in other mining counties in the nortb. Old modes and practicee are clung to with tenacity, and thsre exists an unnsual amount of prejudice against new invsntione and appliauces. The more intslligent classes of ths community thsre, ae elsewhere, of course understaud the fallacy of euch notions and know that thsy must yisld to the necessitise of the times. Still we must confess that even on this coast where mining holds such an important position, an unwarranted prejudice exists against the majority of new processss and machines which ars intendsd to facilitate opsrations. Nsvsrtheless, when once the value of any of thsss invsntious is *proved* by actusl, practical work it finde favor. Nor must its success be a local one, for the processes and machinsry of ths old world, if more applicable than thoee invented and used hers, are applied in certain localitiss, whsre they are specially useful.

Judging from the accounts in the Englisb press, and mors particularly the *Mining World* of London, this is not

The Case in Cornwall.

Ssveral mechanical appliances, well known here, have bsen introduced with great advantage in many othsr parts of England, but still do not find favor in tbat county which, though long cslebrated for its pumping engines, and well posted *practical* miners, has mads very little advancs in miuing machinsry for driving for, or dreseing ores. Ths Burleigh Drill, which bas been found so effective here and in the East, as wsll as many parts of Europs, is not in use iu Cornwall, whsre proof of its economy bae not sufficed to introdncs it. There are only two stone-breakere iu tbe county, and the first one of these, in tbe Terras mine, would not have come so soon, according to ths *Mining World*, but for the euterprise of an Amsrican gentleman. Girls are kept at work which tbe rock-brsaksr could do with lsss expense and greatsr efficiency. The same papsr ssys some improvemeuts have been made in dressing machinery, but it is far from perfect.

Much complaint is made abont the falling off from former daye in the effectiveness of tbe Cornish engines, for which various reasons are given. First, that ths enginesrs are not allowed the eams control over the machinery as formerly. Second, that the engine-men employed are in most cases either crippled miners, shoemakers, tailors or othsr broken-down artisane who know nothing about an engine; and something may bs attributed to the quality of ths coal used. The deptb of many of the mines, the aged and consequeutly defective machinsry, and the almost constant stream of emigration from Cornwall ie causing it to retrograde, and the *World* calls on all interested to mest the evils. It very sensibly takss the ground that machinery for all mining purposes must to a certain extsnt euperseds laborers as it has already done iu large mannfacturing districts. It quotee from a correspondent, who calle for stockholdere generally to contribute towards giving handsome premiums for improvemeuts iu different departmente, and at tbe same time try and convince many of the superintendents that they are not in posesession of so much useful scientific knowledge as they think, wheu it may act as a stimulus further to acquire more.

It seems as though many of our mining men must be descendants from the prejudiced Cornish miners referred to by tbe *World*, for we well know with what difficulty, generally speaking, inventors introduce their appliancee until they are thoroughly tested. Oftentimes they are, if impecunious, as is generally the case, several yeare in getting eome one to try their machinee or proceeses. It is probable that this will never be obviated uutil we have

A Mining School

On a scale which will afford advautagee for

testing, comparatively and practically, new inventions and processes, and which will furnish data of all snch experiments to snch as may need them. Now, sucb data are difficult to get and are not always considered reliable. The great loss of the precious metals, even with our advanced systems of amalgamation and reduction, calls for more satisfactory machinery than is at present in use. The acknowledged waste is enormous, and the wonder is that tho miners of this coast have done as well as they have under the systems in vogue. We hope, some day, to see an institution fonnded whicb shall have special care of snch questions as these, as tbey are of national importance. Perhaps then some of our woalthy mine owners, if convinced that there will ho any profit to themselves, may combine to offer premiums for machinos or processes which shall bo improvements on those iu use, so as to call the inventive genins of the country into requisition to remedy existing evils. Genius is proverhially poor; with inventors it is a chronic complaint, and unless inducements are held out to them in this partioular department our progress in the mechanical appliances of mining will be slow.

In this connection we may remark that dynamite, or

Giant Powder,

Which is a great success in mining operations on this coast, is just heginning to attract the attention it merits in England. There they are now carrying on exhaustive experiments with it to test its efficacy. Here we have practically proved its valne, and the largely increased consumption shows that it is properly appreciated. When this substance was first introduced in our mines there was a great cry raised about its dangerous qualities and poisonous fumes; and in connection with the question of single and donble handed drilling caused considerable trouble and a few "strikes." This whole matter was commented upon at length in our columns at the time, and we tried to show the mining commnnity that its nse would prove beneficial not only to the miue owner but to the lahorers. The Grsss Valley *Union*, of the 20th nlt., in speaking of the demand for skilled labor and of a particular mine which offered advanced wages for it, says that these higher rates were offered for men to nse single handed drills and Giant Powder. Suppose an assertion to tbat effect had heen made a few years ago! The idea would have heen scouted. But it now appears that single hand drills and the Giant Powder do not knock down wages; nor do they lessen the demand for minors. On the other hand, says the *Union*, more men are wanted now than over before in the history of miuing in that part of the country and better wages are offered. The usual effect of all improvements follows here, as it has always followed improvements everywhere and iu every age of the world. Improvemonts in machinery or iu material do lighten the hurdens of lahor and pay the lahorer better for his light labor than he was paid when he had to toil the harder. The miners ought to hegin to see that improved agents for production make a greater and a better demand for labor. It is to be hoped that miners will see the advantage of using this substance in their operations, since it has proven so heneficial, and really, as will he seen hy what has been given above, has become a blessing rather than a bane to laboring men.

Goat Island.

The accompanying illustration represents Goat Island, the famous bone of contention between the Railroad Company and San Francisco. The view shows only the eastorn and lower end of tho island, with the military post located there, and was taken from the high southerly point looking northerly. The proper name for the island is Yerba Bnena, a Spanish name meaning "good herb," a plant which grows in ahundance upon it and which was supposed hy the Mexicans to ontain medicinal virtues. The place is now used as a military post, heing a Government reservation. It lies between Oakland and San Francisco, to the left of the ferry route between those placos ahont half way between both shores; it is, however, in reality nearer to Oakland, since the shoal water on that side permits the building of wharves very close to it.

YERBA BUENA OR GOAT ISLAND, IN SAN FRANCISCO BAY.

The famous "flats," where it was supposed the Railroad Company contemplated huilding a new city to rival San Francisco, lie just off and around the point seen near the right of the picture, embracing some two or three hundred acres of shallow water. The Central Pacific Railroad Co's wharf, whence the overland passengers are ferried across to San Francisco, lies just in range of and heyoud the heavy foliage shown on the extreme right.

The island is a prominent land mark in the hay. Its shores were formerly a favorite resort for fishing parties, but since its occupation hy the Goverument, and people are not allowed the freedom of the place, this has heen discontinued.

Utah Items.—All kinds of busiuess is reported brisk in Utah, and very little snow in the miuing districts. About 200 tons of ore per day are received in Salt Lake City from Little Cottonwood, and heavy receipts of bullion from the South for New York. Some ore is also being sent to Pittsbnrgh. A corporation entitled the "Salt Lake Iron Company," capital, $1,000,000, has heen organized in New York. They have bonght out the Salt Lake Iron Works.

Mare Island.—One day last week a wholesale discharge and snspension took place at the Mare Island Navy Yard. It included nearly all the men in the construction department and six of the foremen.

Proposals for Building Materials, Etc.—We wonld call the especial attentiou of mechanics and contractors to the proposals advertised in another colnmn for materials and work for the new City Hall huilding, in this city. Heavy calls are made for brick, lime, iron wood, etc.

The New Code Corporation Assessment Law.

This law will come in force on the

First of January, 1873.

In tbe reqnirements for advertising there is no change. There are several alterations from the old law, however, which should be generally kuown, and we have therefore published it in full on page 358, of this issue. It will also be printed with a convenient table of dates for weekly advertising and circulated free from tbis office. The following are the principal

Changes from the Old Law Regarding the Levying and Collecting of Assessments:

No one assessment shall exceed "five" per ceut. is changed to "ten" per cent. The word "Directors" is snbstituted for "Trustees."

In the form for assessment notices the "location of principal place of business" is stated instead of "location of works."

Iu the section providing that the Secretary "shall sell, or cause to he sold," the following words (referring to the Secretary) "who is herehy fully empowered and authorized" are stricken out—prohably hecause they were considered simply as superfluous.

It is provided that the dates fixed in notices of assessments and sales may be "from time to time extended for not more than 30 days," instead of "once extended for a period of not more than 30 days."

In this notice we refer only to the requirements for advertising notices of assessments and sales, and the changes in that part of the new law referring especially to levying and collecting assessments.

Fire.—The cinders and sparks from the stacks of the Ruby Consolidated furnaces bas set fire to the wood pile of the Phœnix Smelting Works several times recently. Changes are heing made at the Ruby furnace to prevent a recurrence of the accidents.

The Quicksilver mine, at Mount Pleasant, Monterey County, is reported in a prosperous condition. Reduction works are to be erected.

Mining Assessment Law from the New Code.

Directors may levy assessments. The Directors of any corporation formed under the laws of this State, for the purpose of paying expenses, conducting business, or paying debts, may levy and collect assessments upon the capital stock thereof, in the manner and form and to the extent provided herein.

Limitation. No one assessment must exceed ten per cent. of the amount of the capital stock named in the articles of incorporation, except in the casss in this section otherwise provided for, as follows:

How levied. 1. If the whole capital of a corporation has uot beeu paid up, and the corporation is unable to meet its liabilities or to eatisfy the claims of its creditors, the assessment may be for the full amount unpaid upon the capital stock; or if a less amount is sufficient, then it may be for such a percentage as will raise that amount;

2. The Directors of railroad corporations may assess the capital stock in installments of not more than ten psr cent. per month, unless in the articles of incorporation it is otherwise provided;

3. The Directors of fire or marine insurance corporations may assess such a percentage of the capital stock as thsy deem proper.

Levy of assessment. No assessment must be levied while any portion of a previous one remains unpaid, unless:

Old assessment remaining unpaid. 1. The power of the corporation has heen exercised in accordance with the provisions of this Articlo for the purpose of collecting such previous assessment;

2. The collection of the previous assessment has been enjoined; or

3. Ths assessment falls within the provisions of either the first, secoud or third subdivision of Section 332.

What order shall contain. Every order levying an assessment must specify the amount thereof, when, to whom, and where payahle; fix a day, subssquent to the full term of publication of the assessment notics, on which the unpaid assessment shall be delinquent, not less than thirty nor more than sixty days from the time of making the order levying the assessment; and a day for the sale of delinquent etock, not less thau fifteen nor more than sixty days from the day the stock is declared delinquent.

Notice of assessment. Upon the making of the order, the Secretary shall cause to he published a notice thereof, in the following form:

Form. (Name of corporation in full. Locatiou of principal place of husiness). Notice is hereby given, that at a meeting of the Directors, held on the (date), an assessment of (amount) per share was levied upon the capital stock of the corporation, payable (when, to whom, and where). Any stock upon which this assessment shall remain unpaid on the (day fixed) will he delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on the (day appointed), to pay the delinquent assessment, togother with costs of advertising and expenses of eale.

(Signature of Secretary, with location of office.)

Publication and service. The notice must be published once each week for four successive weeks, in some daily or weekly paper puhlished at the place designated in the articles of incorporation as the principal place of bnsiness, and also in eome paper puhlished in the county in which tho works of the corporation are situated, if a paper is published therein. If the works of the corporation are not eituated within some State or Territory of the United States, then publication in a paper of the place where situated is not necessary. If there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication must be made in the newspaper published in an adjoining county. The notice may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally; and in case of such service upon all the stockholders of the corporatiou, no notice by publication is necessary, but such personal notice is sufficient.

Delinquent notice. If any portion of the assessment mentioned in the uotice remains unpaid on the day epecified thereiu for declaring the stock delinquent, the Secretary must, unless otherwise ordered hy the Board of Directors, cause to be puhlished in the same papers in which the uotice hereinbefore provided for shall have been published, a notice eubstantially in the following form:

Form. (Name in full. Location of prinoipal place of business). Notice.—There is delinquent upon the following described stock, on account of assessment lovied on the (date), (and assessment levied previous thereto, if any), the several amounts set opposite the names of the respective shareholders, as follows: (Names, number of certificate, number of ehares, amount). And in accordance with law (and an order of the Board of Directors, made on the [date], if any such order shall have heen made), eo many sharee of each parcel of such stock as may be necessary, will he sold, at the (particular place), on the (date), at (the hour) of euch day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

(Name of Secretary, with location of office.)

Conteuts of notice. The notice must specify every certificate of stock, the number of shares it represents, and the amount due thereon, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued, must be etated.

How published. The notice, when published in a daily paper, must he published for ten days, exclnding Sundays and holidays, previous to the day of sale. When published in a weekly paper, it must be published in each issue for two weeks previous to the day of sale. The first publication of all delinquent sales must be at least fifteen days prior to the day of sale.

Jurisdiction acquired, how. By the publication of the notice, the corporation acquires jurisdiction to sell and convey a perfect title to all of the stock described in ths notice of sale upon which any portion of the assessment or costs of advertising remains unpaid at the hour appointed for the sale, but must eell no more of such stock than is necessary to pay the aessessments due and costs of sale.

Sale to be by public auction. On the day, at the place, and at the time appointed in the notice of sale, the Secretary must, unless otherwise ordered by the Directors, sell or cause to be sold at public auction, to the highest hidder for cash, so many shares of each parcel of the described stock as may be necessary to pay the assessmeut and charges thereon, according to tbe terms of sale; if payment ie made hefore the time fixed for sale, the party paying is only required to pay the actual cost of advertising, in addition to the assessment.

Highest bidder to be the purchaser. The person offering at such sale to pay the assessment and costs for the smallest number of shares or fraction of a share is the highest bidder, and the stock purchased must be transferred to him on the stock books of the corporation, on payment of the assessment and costs.

In default of bidders, corporation may purchase. If, at the sale of stock, no bidder offers the amount of the assessments and costs and charges due, the same may be bid in and purchased hy the corporation, through the Secretary, President, or any Director thereof, at the amount of the assessments, costs, and charges dne; and the amonnt of the assessments, costs, and charges must he credited as paid in full on the books of the corporation, and entry of the transfer of the stock to the corporation must be made on the books thereof. While the stock remains the property of the corporatiou it is not aseessable, nor must any dividends be declared thereon; but all assessmeuts and dividends must he apportioned upon the stock held by the stockholders of the corporation.

Disposition of stock purchased by corporation. All purchases of its own stock made by any corporatiou vest the legal title to the same iu the corporation; and the etock so purchased is held subject to tho control of the stockholders, who may make such disposition of the same as they deem fit, in accordance with the hy-laws of the corporation or vote of a majority of all the remaining shares. Whenever any portion of the capital etock of a corporation is held by tho corporation hy purchase, a majority of the remaining shares is a majority of the stock for all purposes of election or voting on any question at a stockholders' mesting.

Extension of time of delinquent sale. The datss fixed in any notics of assessment or notice of delinquent sale, published according to the provisions hereof, may be extended from time to time for not more than thirty days, by order of the Directors, entered on the records of the corporation; but no order extsnding the time for the performance of any act specified in any notice is effsctual unless notice of such extension or postponement is appended to and publishsd with the notice to which the order relates.

Assessments shall not be invalidated. No assessmeut is invalidated by a failure to make publication of the notices hereinbsfore provided for, nor by the non-perfo:mance of any act required in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previons proceedings, except the levying of the assessment, are void, aud puhlication must be begun anew.

Action for recovery of stock, and limitation thereof. No action must he sustainsd to recover stock sold for delinqusnt assessmeuts, upon the ground of irregularity in the assessment, irregularity or dsfect of the notice of sale, or defect or irregularity in the sale, unless the party seeking to maintain such action first pays or tenders to the corporation or the party holding the stock sold, the sum for which the same was sold, together with all subsequent asssssments which may have been paid thereon and intsrest on such sums from the time thsy were paid; and no such action must be sustained unless the same is commsnced by the filing of a complaint and the issuing of a summous thereon within six months after such sale was made.

Affidavits of publication. The publication of noticss required by this Article may be proved by ths affidavit of the printer, foreman or principal clerk of ths paper in which the same was published; and the affidavit of the Ssoretary or auctioneer is primary evidence of the time and place of sale, of the quantity and particular description of the stock sold, and to whom and for what price, and of the fact of the purchase money bsing paid. The affidavits must be filed in the office of the corporation, and copies of the eame, certified by the Secretary thereof, are primary evidence of the facts therein stated. Certificates, signed by the Secretary and under the seal of the corporation, are primary evidence of the contents thereof.

Affidavits of sale.

To be filed.

Waiver of sale. On the day specified for declaring the stock delinquent, or at any time subsequent thereto aud before the sale of the delinqnent etock, the Board of Directors may elect to waive further proceedings nnder this Chapter for the collection of delinquent assessments, or any part or portion thereof, and may elect to proceed by action to recover the amount of the assessment and the costs and expenses already incurred, or any part or portion thereof.

Action to recover assessment.

The New Oil Wells on the Ojai--Their Appearance and Prospect.

For several years says the Ventura *Signal*, tbe vast petroleum producing region lying between Point Concepcion aud the San Fernaudo Mountains, embracing a lougitudinal exteut of over 100 miles, has been a ficld of great interest to the scicntist and to a few practical oil miuers. But while all are agreed as to their wonderful extent and prospective value, and altbough much money and time has been expended in experiment, very little has as yet been done towards practical development. Tbis want of success ie mainly attributable to two facte—the principal and most formidable beiug the great dissimilarity in tbe geological structure of thie and all other knowu oil-produciug regions, and the other the exorbitant cost of labor and all material necessary in extracting aud refining. The want of a market for the crude petroleum, sucb ae is afforded in the Eastern States and Europe, has also been a eerioue drawback.

But all of these and other obstacles in the way of succese are vaniehing, and the day is not distant when the petroleum and asphaltum of Southeru California will be one of her principal sources of wealth. We hazard nothing in the statemeut that, if all the oil now running to waste on the Ojai, ex-Mission and Sespe ranches, lying between the San Buenaventura and Santa Clara rivers, were saved and put into tbe market, even at the present low price ($4 per barrel), it would bring more money into Ventura county than all her barley and wool crops.

But we only set out to speak of the new borings lately begun by tbat veteran oil miner, Cbas. Stott. The location of hie works is on the Ex-Mission, about 18 milee east of tbis place, aud at the extreme soutbern base of the oil-bearing belt, which, at this point, is some three or four miles wide. It is also at the base of Sulphur Mountain, near the point of its bisection by tbe Santa Paula Creek, a large, never-failing mouutain etream. Ascending a few feet from the creek bottom on to a beautiful table land, the road leads over it a mile or more and enters a pretty, funnel-shaped little valley, where the wells are situated. It is as secluded and charming as a hermit could wish; tbe hills on every side, except at the entrauce, are precipitons, grass-covered, and about 1,000 feet iu hight. They are treelees and shrubless, but just to the north a few hundred yards is a grove of fine oaks. Tbe first thing that attracts attention is the "villainous smell" of oil, tbe enormous deposits of asphaltum, and the oozing, bubbling, black, sluggish rivulets of petroleum. These mineral tar spriugs break fortb from the base almost to tbe summit of the hills in a hundred placee. The principal rock, which in placee is exposed to the surface, and which is apparently the oil bearing measure, ie a soft, stratified argillaceous clay slate, with an inclinatory dip to the north of about 60°. No deviation from this forniatiou is perceptible at this point except in a single instance, where, at an elevation of about 100 feet above the lower springs, a single stratnm of sandy slate protrudes, being only a few feet iu width, and having the same etrike and dip as the surrouuding formation.

In thie little, oleaginous nook, G. S. Gilbert, Sr., collected and distilled petroleum as early as 1854; and abont the same time Juilo Peralta dug pits, gathered the miueral and carried it to the works of the Philadelpbia Compauy at Camuloe. But it did not pay, and was soon abandoned. In 1866 Mr. Stott began operations by running a tunnel and erecting refining works on a small scale. Having made a few thousand gallons of buruing oil, he, too, gave it up for a bad job, but never lost faith in ultimate success. Giving up tbe tunnel which had been run, including the open cut of 350 feet, he began siuking the well known as No. 1, "going slow" and feeling his way, ae "a burnt cbild dreads the fire." Having under every difficulty and discouragement, attained a depth of 50 odd feet, and meeting with but a small flow of oil—about two barrels per day—he started well No. 2, only a few rode from the first. Thie was bored 80 feet, but affords only a small quantity of oil, and rather "heavy" at that. No. 3 was tben commenced and is still under way, being eome 60 feet in depth and produciug about two barrels of good oil. In August the fourth boriug was started and put down to a deptb of 87 feet, when a flow of eight or ten barrele was obtained, and of au unusually fine quality. This is beginniug to realize the Major's long cberished hopee. These four wells have been sunk by himself and son with from one to two assistante, and witb but little outlay of money. They are untiring workere eanguine in the belief, and certainly with great reason, that millions lie stored in tbose hills only awaiting development. All who know of their toils and disappointments rejoice at their final success and future prospecte. The seeker after knowledge or pleasure will alwaye find the latch-string of their hospitable miner's cabin on the ontside, and a kindly welcome. There is no point of greater interest than these oil regions, and the wonder is that they are not better known.

Queer Freak in a Mine.—Under this heading tbe San Diego *World* hae the following:—From a gentleman who lately got down from Julian District, we learned of some singular developments that lately took place in San Diego No. 1. The boys have been working the mine for some three years. It is on tbe line of tbe Helvetia. Tbe first shaft was sunk one hundred feet, when a copious epring of water wae reached. On this level fair rock was struck that averaged thirty dollars a ton. Tbe ehaft wae coutinued till a depth of one hundred and eeventy feet was reached. The water followed and tbe mine filled up so rapidly that the boys bad to euspend work. They had got througb the blue gouge on the footwall when operatious came to a stand-etill. The water rose rapidly to a hight of three or four sets of timbers. In a few days a descent was made to ascertain how mattere looked. Two sets of timbers were found afloat in the shaft. They at ouce went to bailing out, aud a siugular discovery was made. The blue gonge had all slacked from the walls, and they stood fully twelve feet apart. They were beautifully hard and smooth.

This is a very singular and a very rare occurrence. Our informant says he uever knew of a circumstance of the kiud except in the Eureka mine, in Grase Valley. The miners are firuly persuaded that they have struck the "mother mine" of the wbole Julian and Banner district. In this lower shaft some quartz was struck, with iron pyrites at the bottom.

Tbe boys fully believe that they have but to persevere to strike something very rich. They are determined to follow the fissure, if it takes them five hundred feet into the bowels of the earth. Owing to the rapid flow of the water they are obliged to suspend work until they have secured an apparatus for pumping out the mine. We shall watch further developmente in tbis mine with curiosity.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER.
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivelled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only wey to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powdsr, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,

PAUL'S PULVERIZING,
Self-Feeding and Self-Discharging
BARRELS,
For the reduction of ores, dry, to an impalpable powder or any given fineness, are made of any capacity—4, 6, 10, 20 or 50 tons per day. The reducing material is quartz from mine working upon coarsely-crushed ore from batteries or other machinery. No ore discharged for amalgamating that does not pass through wire cloth having eight thousand and one hundred holes to every square inch of surface.
The practicability of these barrels are established by the working of hundreds of tons of ore. Several are now building at the Miners' Foundry and can be seen by those interested. For particulars appy to
ALMARIN B. PAUL,
2v25 No. 218 California street, up stairs.

Academy of Sciences.

The regulsr semi-monthly meeting of the California Academy of Sciences was held Monday evening. The following new membere were elected: Henry F. Williame, J. D. Pierson, Dr. John M. Willey, Barington Gethen, Richsrd Gird and Richard L. Ogden. The donstione to the cabiuet were made as followe: Specimene of Pscific Coast woods, from G. W. Harford, among them California yew, Western dogwood, hemlock, *Taxus brevifolia*, maple (large leaf), giant arbor vitæ, Pacific alder, white fir, vine maple, yellow Alaska cedar and wild cherry. Wm. Burling presented a specimen of precipitated copper from a mine at Copperopolis. The ehaft had become filled with water, and the copper held in solntion was precipitated upon a pick lying in the bottom. The iron had been entirely consumed and the mass of copper had cemented with it pieces of chipe, etc. Professor Davidson presented a collection of insects from the Sierra Nevadas; and Mr. Dursnt a Map of Pioche Mining District. Dr. Blake read an interesting paper on the

Barometric Anomalies in the Great Basin.

In a paper read before the Acsdemy a few weeke since on the hight of the divide between the watere of the Great Basin and the Columbia, Dr. Blske stated that the barometrical observstions he msde at Winnemucca, as compared with those of the snmmit, gave a difference of level between these two pointe about one hundred feet less thsn had been messured in the trigometrical eurvey of the Central Pacific Rsilroad, and also thst a few observations msde at Verdi at the same time by Profeesor Davideon had ehown almost as great a difference between the hight of that station as meaeured by the bsrometer or by direct levelling. In endeavoring to account for thie discrepancy between the resnlts of these two methods of measuring, the Doctor was led to aecertain the effects of the direction of the winds on the comparative hight of the barometer at the two etations, and although he could find nothing in the direction to explain the anomaly ahove slluded to, yet his inquiries led to the discovery of an interesting fact which, if it should be verified by further investigation, forms a remsrkable exception to the usual daily fluctuations of the bsrometer.

As a usual thing the barometer is subject to diurnal chsnges, so that there are two minima, one at 9 A. M. snd the other at 9 P. M.; and two minima at 3 P. M. and 4 A. M. The Doctor found that during the prevalence of southerly winds his obeervations showed the normal diurnal ries and fall of the barometer, the meau of the observations at Puebla giving 7 A. M., 25.468; at 2 P. M., 25.393; at 9 P. M., 25.479; and at the summit of the same place, at 7 A. M., 23.233; at 2 P. M., 23.217; at 3 P. M., 23.276.

During the prevslence of northerly winds, the regular diurnal rise and fsll of the barometer is apparently reversed, the maxima occurring at 2 P. M., and the minima at 7 A. M. and 9 P. M. The mean of the observations during the prevalence of the northerly wind, giving for Puebla, st 7 A. M., 25.569; at 2 P. M., 25.576; at 9 P. M., 25.494. For the eummit, at 7 A. M., 23.305; at 2 P. M., 23.361; at 9 P. M., 23.293.

During the time these observations were being msde the weather wae fine, there beiug no unnsual atmospheric distnrbance, the north snd south winds alternating, as they ueually do in this part of the country during the month of June. The obeervations extended ovcr eighteen days, ten days of north winds, snd eight days of eonth. Theee observations, few as they are, evidently indicste certain anomalies in the movements of the barometer in this portion of the continent, which must render the inetrument a very unsafe means for determining highte; a conclnsion which Mr. Gardiner informed Dr. Blake, had been fully verified by him during his survey on that portion of the Fortieth Parallel, which lies iu the Great Basin.

Other Baromelric Eccentricities.

Dr. Gibhons addreesed the Academy in reference to the irregular indicatione of the barometer on this Coast, and illustrated his remarka with diagrams. He had noted here the passage of the barometric wave observed iu the Eastern States and Europe, which every year preceded the advent of winter. But in this part of the continent, the rise and fall of the barometer, as indicating the character of the weather to follow, seemed to be entirely unreliable. The heavy rain which set in on Friday last, the 29th ult., was preceded by a rapid rising of the barometer for four or five hours. While the rain continued, the barometer remained steady, aud its deseent on Saturday and Sunday was followed by heavy fogs. The speaker remarked that the barometer was indulging its usual eccentricities that evening, but what it meant was beyond the power of human discernment to determiue.

Letter from Professor Tyndall.

The Secretary read the followiug letter, addressed to Professor Davidson, as President of the Academy, from Professor Tyudall:

DEAR SIR.—I fear tbat during my present visit to America it will be out of my power to go so far as San Francisco; though I should feel great pleasure in lecturing there nnder the auspices of the California Academy of Sciences. Indeed, it is in connection with such inatitutions that I should like to deliver all my lectures, my viait being one in reaponse to the invitation of my scientific friends, rather as a proof of friendly feelings than with any view to financial matters. Perhaps it may fall to my lot to return to America, and if I do so, I shall not fail to remember your invitation.

Believe me, dear sir, faithfully yours,

JOHN TYNDALL,

Mr. Goodyear, of the State Geologicsl Survey, resd a paper on a trip throngh Oregou, in which he gave eome interesting details conceerning its gold sands and the coal fields. Space forbids its pnblicstion in this issue, but we will give it next week.

Dr. Kellogg presented and described a large herb which bears the same relstion among its class as the *Sequoia gigantea* among trees. It growe on Sau Miguel Island, off Santa Barbara, and hae a very large trunk in proportion to its size; it is slso remarksble for its fragrance.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

By Special Dispatch, Dated Washington, D. C., Dec. 3d, 1872.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

CAR COUPLING.—Mordecai Dieney, Oaklend, Cal.

APPARATUS FOR COATING SEED WHEAT WITH SULPHIDE OF COPPER.—Daniel Best, Marysville, Cal.

SUBSOIL PLOW.—Christisn Myers and William Gummow, Marysville, Cal.

PREPARING ORES FOR AMALGAMATION.—Almarin B. Paul, S. F., Cal.

WHEELBARROW.—Calvin Nntting and Calvin Nntting, Jr., S. F., Cal.

PAINTERS' STRIPING IMPLEMENT.—Daniel Lydon and Charles Haleey, S. F., Csl.

LUBRICATOR.—Willism T. Garrstt, S. F., Cal.

——*The patents are not ready for delivery hy the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwiae) at the lowest ratea. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. MINING AND SCIENTIFIC PRESS, American and Foreigu Patent Agency, the following are worthy of mention:

SEWING MACHINE.—A. D. Hopkins, Ssu Francisco. Iu this machine the needle bar is operated by a long lever which is pivoted nt one end and has the other end connected with the needle bar. A link from the lever at some point between its points of attachment, connecte it with one end of a bar, the other end being attached to a crank. This bar slidee throngh sn oscillating block when the crank is turned, and through the link, operatee the lever and gives it the pecnliar motion necessary to form the loop and maintain it so that the shuttle can psss through to mske the stitch. In a good eewing mschine the old principle (the cam movement) mnst be maiutained, of causing the needle bar to remsin stationary during s portion of each stroke to give time for the shuttle to psss through the loop formed by the needle so ae not to draw undue slack while pssaing through the loop which has to be taken up by eprings. This principle has hitherto been obtained by means of irregular groovee formed on the disk or periphery of a wheel or curved slots. All ench machines must have great wear and tear from the great friction, and at the same time canse considerable noise. This machine is the only one which prodncee this movement by the aid of levers, without cams, curved slots, or cog wheels. This principle can be applied to a machine of any size from the ordinary size up to one with an arm six or eight feet long, without increasing the bulk of the machine. This one is comparatively noiseless, and does not seem liable to get out of order easily.

SUBMARINE DREDGER OR EXCAVATOR.—A. J. Gove, San Francisco. This inveution relates to that class of submarine dredging machines in which a bucket is used, made in two sectious and united by a joint at the upper corner of their meeting edges so as to open and shut. Theee are more commonly known as the clamshell dredging machine. The improvement of Mr. Gove consiste of a novel arrangement for euspending and operating theee jointed buckets, by which they can be more easily controlled and hy which they are rendered more effective than by the meane at present used.

IMPROVEMENT IN VENEER CUTTING MACHINES.—E. S. Gilmore, San Francisco. This is an improvement in machines for cutting or slicing off thiu veneers or stripa from a previously prepared block of wood, and it consists principally of a device for automatically feeding said block to the cutting knife without requiring the attention of the operator, aud capable of doing a greater amount of work than is usual in a more perfect manner and with lesa trouble.

TELEGRAPHIC SIGNAL KEY. — Arthur B. Shearer, Davisville, Yolo Co. Cal. Thie is a telegrsphic signal key of novel constrnction, which will be more direct in ite action, and ite operation more positive than the usual lever key, which is mounted upon a horizontsl axis. The especial novelty connected with this invention is its vertical srrangement hy which the action and resction of the key is freely produced without danger of an imperfect responee to the manipulation of the operator. The device ie simple and not liable to get out of order, and has all the necessary appointments for convenience in operating.

MEDICAL COMPOUND. — D. Mayon aud E. Champlain, Cloverdale, Souoma Co., Cal. These gentlemen claim to hsve discovered a cure for dyspepsia, which is called Mayon, Champlsin's Ligneoue Extract, and as its name impliee ie extracted from wood by a peculisr procese. These gentlemen have opened an office on California street, betweeu Montgomery and Kearny, in this city, where dyspeptic persons can teet the merits of the invention.

LOCKING DEVICE FOR WINDOWS. — Henry Polley and A. Rosenfield, San Francisco. This is an improved locking device to be employed chiefly upon windows, but which is also applicable to auy sliding frames. It consiste maiuly in the employment of a plate which is moved from the side of the window cssing against the edges of the sashes, so as to bind either one or both firmly against the opposite casing. A cam or suitable lever is employed to operate the clamping plate.

Text of Interesting Decisions in Patent Cases.

COMMISSIONER'S DECISIONS.

[In the matter of the application of Thomas J. Chubh for patent for HEATING APPARATUS, filed October 2, 1872.—Appeal from Primary Examiner.—Decided October 15, 1872.]

A caveat should not be cited in a specification, in an application for patent, because it pertains to the history rather than the description of an invention.

A patent may properly be referred to in a specification for the purpose of clearly distinguishing an invention pending an application for patent.

Applicant says, iu his statement of the uature of his invention: "My invention is set forth and shown in a caveat filed by me in the Pateut Office of the United Statee, June 29, 1854;" and he makes several allusions to this caveat in the body of his specificstion. The Examiner requires all reference to the caveat to be expunged; upon which ruling an iseue ie made and this appesl is taken. The statute requiree thst before a pstent shall issue for an invention, the applicant "shall file in the Patent Office a written description of the same, * * * in such full, clear, concise, and exsct terms * * * ae to enable sny pereon skilled in the art to make, construct, compound, and use the same." The charscter and the object of the description required are thus definitely specified. A reference to a csveat concerns the hietory, snd not the description, of an invention, and is for that reason excluded by the language quoted. Besides, a csveat is required to be filed "in the confidential archives of the Office and preserved in secresy." It could therefore furnish no informatiou to the public descriptive of an invention, even thongh it were in its nature calculated to do this. Butit ie not. It is a special instrument for a dietinct and peculiar purpose. It proceeds upon the theory that an invention is not yet completed, and it has no place, by reference or otherwise, in a specification for patent. There can be no legitimate object in its incorporation there. If admitted while operative, it would be divested of its secret charscter, which is its chief excellence for the ende it is designed to subserve, and in caee of an interference the adverse party would be entitled to inspect it or demand a copy. But eo far as applicant is concerned, its legitimate benefit to him is reserved, notwithstanding tbis adveree action, because he cau in any event only properly use it as evidence. To be sure, applicant has made his caveat public, to eome extent, iu this case, by filing a copy of it with this application. Bnt the Office cannot properly go so far as to indorse it in advance as bearing upon the date and identity of subject-matter of the invention now songht to be patented. This record must be made full and complete in ilself as to date and description, and all extrinsic matters may be shown elsewhere. They are simply surplusage here as they would be in pleadings—evideuce of facts, but not the facts themselves, which are required. It is urged in argument to snstain this motion that reference in a specification to a preceding patent is sometimes sanctioned. This is only the case, however, when it is made for the purpose of aiding description, by distingnishing more clearly an invention pending an application for patent. Such refereuce is never sanctioned for the purpose here sought to be accomplished, of showing identity and of establishiug date.

The action of the Examiner is sustained and the motion refnsed. LEGGETT, Commissioner.

SAN DIEGO FOUNDRY.—The telegraph tells us that a block of laud has been purchased in San Diego for the erection of a machine shop and foundry. The building is to be completed by January let, the construction-contract having been let.

IMPROVEMENT IN SPRING BEDS.—"Tired nature's sweet restorer, balmy sleep;" but in order to thoronghly enjoy it, how neceeeary it is to have a suitable couch for the weary limbe. Without this luxury, we toss from side to side and vainly woo the drowsy god. Of all the benefactors to mankind in the line of beds, that of Mr. A. T. Sherwood of Sacramento eecms to bear the palm for cheapneee, cleanliness and comfort. The beds are made of wooden springs so combined as to possess the greatest elasticity and movement in every direction, and they sre at the same time very strong. They are equslly elastic under the lightest child or the heaviest pereon, and never receive any permsnent set by hard use, ssis the case where copper springs are employed. Being entirely open they sre very clean, and easily kept free from vermin, and the lsrgest beds only weighs 25 or 30 pounde. The inventor is prepared to furnish all clsases of beds down to the miner's cot so arranged as to make either a bed or a lounge, and guarsntees perfect eatiefaction. This bed received the first premium of the Stste Agricultursl Society this year and Mr. Sherwood ie now prepared to furuish the beds in any qsuntity at a very low rate.

New Incorporations.

PARIAN M. Co.—Nov. 29. Location: Ely Mining District. Capital stock, $3,200 000. Trustees—S. Heydenfeldt, M. L. Powers, D. T. Bagley, L. Leavith and Thos. Reilly.

CALIFORNIA IRON M. Co.—Nov. 30. Location: Nevada Co., Cal. Capital stock, $4,000.000, in 40,000 shares. Trustees—A. H. Hagordan, G. W. Terrill, George K. Philips, William H. Sparks and Joseph F. Atwell.

CUPEL SILVER M. Co.—Nov. 30. Location: Wallapai District, Mohave Co., Arizona Territory. Capital stock, $4,000,000, in 40,000 shares. Trustees—Augustus Laver, Horatio McPherson, Juliua Perrault, Henry Raymond and W. H. Smith.

PIONEER CONSOLIDATED M. Co.—Dec. 4. Location: Eureka District, Nevada. Capital stock, $3,000,000, in 50,000 shares. Trustees—Robert Sherwood, J. D. Fry, Malcolm McDonald, James H. Wade and Max Overfelter.

STETEFELDT FURNACE CO.—Capital, $500,000, in 5,000 shares of $100 each. The Directors are Cbas. A. Stetefeldt, John H. Boslt and Eugene N. Riotte. At a meeting of the Directors, Charles A. Stetefeldt was elected President, and B. J. Burns, Secretary and Treasurer. The objects of the Company are the nsing and vending and selling to others the right to use and vend certain patented furnaces and processes for chloridizing silver and gold ores.

MINING ACCIDENTS.—The Grass Valley *Union*, of the 30th ult., tells of three different accidents in the Eureka mine in one day. Frank Chinot, while fixing the shoe of a heavy stamp, had his eyes and face cut, by the stamp suddenly falling and throwing a quantity of gravel in bis face.

David Rodgers had his leg badly injured by a rock falling upon it; and George Northey was injured by the premature explosion of a blast.

Harrison Scott had his foot crushed by the cage in the Idaho mine.

At the Eureka Consolidated, s cave injured two men last week, one of them, Elliott, had bis shoulder broken and his skull fractured; the other, whose name is Lynch, was slightly hurt in the side.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Amazon Silver Mining Company—Location of works, Ely District, Lincoln County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the Twenty-second day of October, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary pro tem., at his office, No. 609 Sacramento street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the sixth day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 22d day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. J. McMANUS, Secretary pro tem.

Office, 609 Sacramento street, San Francisco, Cal.

de7-4t

Bunker Hill Quartz Mining Company—Location of works, Amador, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of December, 1872, an assessment of Ten Dollars per share was levied upon the capital stock of said Company, payable immediately to the Secretary, in United States gold coin, at his office, No. 19 First street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 6th day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction and unless payment shall be made before, will be sold on Monday, January 27th, 1873, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

CHARLES H. KNOX, Secretary pro tem.

Office, 19 First street, San Francisco, California.

Great Blue Gravel Range Company—Location of works, Blue Gravel Range, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of November, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5 and 8, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 18th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 7th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Montgomery street, San Francisco, California. no23

Hudson Gold Mining Company—Location of works, Cherokee Mining District, Plumas County, State of California.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 11th day of Novamber, 1872, an assessment of 7½ cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 411 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 16th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 6th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

JOS. L. KING, Secretary.

Office, 411 California street, San Francisco, California. no16-4t

Indus Gold and Silver Mining Company—Location of works, Virginia City, Storey County Nevada.

NOTICE.—There are delinqnent upon the following described stock, on account of assessment levied on the nineteenth day of October, 1872, the several amonnts set opposite the names of the respectiva sharcholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Barnard, R	79	10	$5 00
Everson, Wallace	89	5	2 50
Everson, Wallace	90	5	2 50

Summers, H	35	5	2 50
Summers, H	36	5	2 50
[In dispute—not issued]		25	12 50

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of October, 1872, so many shares of each parcel of said stock as may be necessary will be sold at public auction, et No. 327 Montgomery street, San Francisco, Cal., on the sixteenth day of Decemher, 1872, at the hour of 10 o'clock A. M., of said day to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretery.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal. no30-3t

Lemon Mill and Mining Company---Notice to Stockholders.

Notice is hereby given, that a meeting of the Stockholders of the Lemon Mill and Mining Company will be held at the office of the Secretary, No. 608 Merchant street, San Francisco, Cal., on Monday, the 6th day of January, 1873, at 12 o'clock M. of said day, for the purpose of voting upon a proposition to increase the capital stock of the Company from two million (2,000,000) dollars, divided into twenty thousand (20,000) shares, of the par value of one hundred (100) dollars each (the present stock of the Company), to Three Million (3,000,000) Dollars, divided into thirty thousand (30,000) shares, of the par value of one hundred (.00) dollars each.

G. W. CLARK, Trustee,
H. H. SCHAFER, Trustee,
JOHN FAY, Trustee,
H. BARROICHET, Trustee,
CAMILO MARTIN, Trustee,
} Lemon Mill and Mining Co.

San Francisco, Dec. 3d, 1872. de7-4t

Mina Rica Mining Company---Location of works, Auburn Mining District, Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of November, 1872, an assessment of thirty cents per share was levied upon the capi al stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 320 California street, room No. 5, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 23d day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public aution, and unless payment shall be made before, will be sold on Monday, the 13th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. R. SPINNEY, Secretary.

Office—No. 320 California street, room No. 5, San Francisco, Cal no23

Mammoth Blue Gravel Company—Location: Chalk Bluff District, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of November, 1872, an assessment of eight cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the secretary.

Any stock upon which said assessment shall remain unpaid on the 23d day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, room 37, New Merchants' Exchange, (third floor), California street, San Francisco, Cal. no23

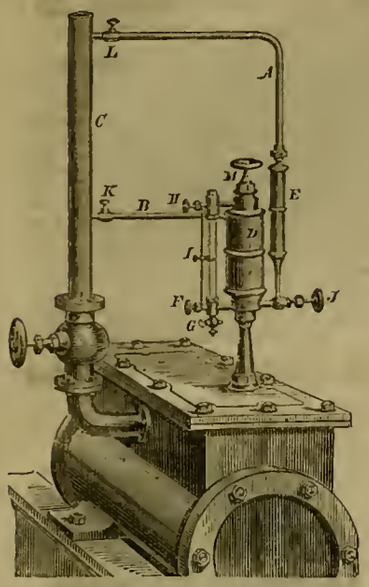
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and steams lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

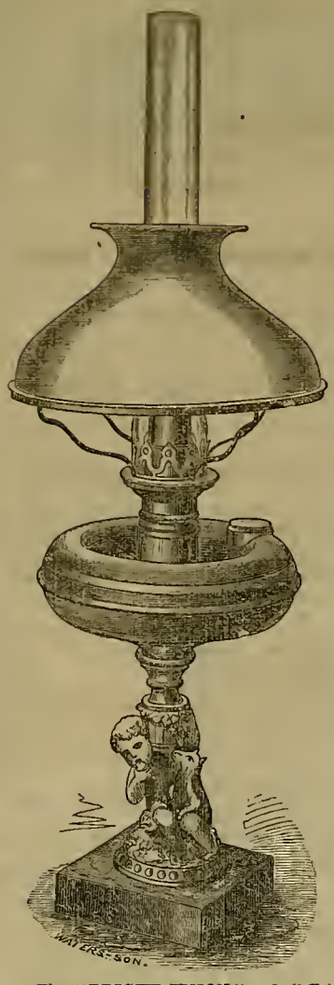
BRIGHT UNION SAFETY LAMP.

A CALIFORNIA INVENTION.

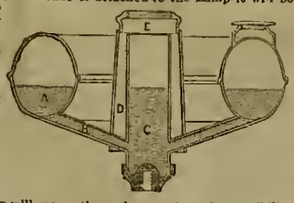


Patented May 30, 1871. Is the Best and Safest Lamp ever put in the market, for the following reasons:

1st.—The Lamp is constructed with two tubes, as will be seen in cut, the outside one (D) intended only for the attachment of the burner, and the inside one (C) to contain oil and receive the wick. As there is no connection between these tubes, it will be evident that there is no possibility of communicating any heat to the oil; and as long as the oil in a Lamp can be kept perfectly cool, there is, of course, no chance for an explosion.

This Lamp is the only one ever invented in which this result has been secured.

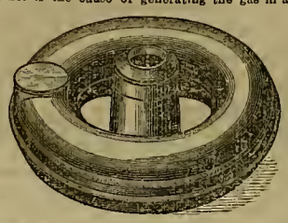
2d.—When the burner is attached to the Lamp it will be seen that there is no opportunity for the oil to escape should the Lamp be overturned, and in case any accident should occur, the worst consequences that could ensue would be the breaking of a chimney or shade. From these facts it will be evident that those who adopt this Lamp will secure themselves against the possibility of fire or explosion arising from the use of kerosene oil.



3d.—The Lamp is strongly and well made, attractive in appearance, and something entirely new and novel. It will burn kerosene adapted to any burner. With all of these advantages it combines cheapness, and from present indications it is destined to become very popular.

4th.—The tube to which the burner is attached (D) is free from the tube of the oil (C), and a space for air, passing from the lower end, between the tube of the burner and the tube of the oil, keeps it always cool.

5th.—The burner is the cause of generating the gas in a Lamp. It cannot do it in this Lamp, as the burner is set on a tube which contains no oil, consequently it cannot make any gas.



6th.—In case of accident, the Lamp falling or thrown over, by which many explosions occur, is the cause of the oil rushing to the flame. In this Lamp it is not so; it can be thrown over and cannot send the oil to the flame; it will run from it, so there is no danger of catching fire.

This Lamp can be filled from the fount, on the top of which is a screw.

This Lamp can be attached to any Chandelier or Bracket made.

State and County Rights for Sale. Agents Wanted.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, aud adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the nams of the article, and ths name of the inventor, and his address npon it.

Send the model (by express or othsr reliable couveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amonnt of first fee of ths Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returnsd to us with ths fess then due us, it will be sent straightway to the Patent Office at Washngton.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficinst to make the expsrimsnt (unless they are of a common and well-known character), and also of the manufactured article itself, must bs furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For dssigns no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illnstrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid Also a copy of NEW PATENT LAW of 1870.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

SUBSCRIBERS may deduct the cost of a registered letter or postoffice order when they remit us their subscriptions that way, but we will not pay the extra expense of sending by express.

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

Should see to it that their advertisements are advertised legally and in the **MINING AND SCIENTIFIC PRESS,** at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. S. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine.

Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

THE PATENT

Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE,
eow-hp 422 Battery street, San Francisco.

THE SANTA BARBARA PRESS,

AN INDEPENDENT NEWSPAPER,

Devoted to the Interests of Southern California.

J. A. JOHNSON, Editor and Proprietor.

As the charming character of Southern California, and more especially that most favored section called Santa Barbara, becomes known to the world, it is not surprising that a widespread and growing interest in this region should be awakened. It is the constant aim of the PRESS to furnish perfectly reliable information on all points of interest to tourists, invalids and home-seekers, wh ch we are now able to do with greatly increased facilities. While the PRESS seeks to promote the prosperity of all Southern California by all legitimate and honorable methods, it is more directly interested in the growth and coming greatness of Santa Barbara. The unequalled loveliness of the climate, its almost incredible healthfulness, the beauty of the scenery, the wondrous variety and fertility of the soil, the almost unlimited range of products which flourish there without irrigation, will be made known by facts which cannot be controverted, in the columns of the PRESS, from time to time. Any intelligent person can become familiar with this part of the State by reading the PRESS for a year.

Terms of the Daily, per annum.....$5 00
Terms of the Weekly, per annum.....$2 50
Currency and Post Office Money Orders taken at par.

W. E. Loomis, L. P. Fisher and Thos. Boyce, San Francisco, are authorized to receive subscriptions to the PRESS.

A WORD TO ADVERTISERS.—As a simple matter of fact, without a word of brag, it is claimed that the SANTA BARBARA PRESS has a much larger circulation than any other newspaper in Southern California, and is mainly read by the more thrifty families of that part of the State, and its advantages to advertisers are obvious. Our rates are moderate, and within the reach of every man who has a business worth advertising. L. P. FISHER and THOS. BOYCE are our advertising agents for San Francisco, though we always prefer to deal directly with advertisers. Address simply PRESS, Santa Barbara, California. bpit

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS,
SAN FRANCISCO, November 25, 1871.

SEALED PROPOSALS FOR FURNISHING CERtain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will he received at the office of the Board of City Hall Commissionors, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;
Stone for Facing of Basement Story and Building the same in the Walls, etc;
Rolled Iron Joists;
Iron Girders and Columns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc;
Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposals can he had on application to the Secretary, and the Plans and Drawings can he seen, and all further information—as to the details of the work, etc.—can be obtained from the Architect, at the office of the Board.

The Bids must he endorsed for the Material proposed to be furnished or Work done, and addressed to the Secretary of the Board.

No Bids will he entertained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or hond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to he returned on the due entering into the contract of the party to whom it may he awarded, or to he forfeited, if the party fail to enter into the said contract.

Each bidder for Brick will state what quantity he will furnish within one year, and at what times he will deliver them. Samples must accompany each bid.

The Board reserve the right to reject any or all bids.

Payments will he made monthly in "City Hall Warrants," of 75 per cent. of estimated amounts duo, and the remaining 25 per cent. when the contract is completed.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,

SAN FRANCISCO, SATURDAY, DECEMBER 14, 1872.

VOLUME XXV. Number 24.

Kill the New Industry.

When it was first proposed to introduce sugar making from beets, in California, it was favored, not only by those who wished to see the large amount annually expended for foreign sugars, kept at home; but by those who were engaged in refining crude or raw sugars and supplying our people with the refined article, believing that the beet sugarine would be a source from whence they might derive raw sugars for the refinery.

But as soon as it was ascertained that beet sugaries were also the refineries of their own sugars, and even of raw sugars obtained from abroad during the season when the sugeries and sugar making are at rest, the whole matter of encouraging the best sugar industry assumed a new phase; for it was evident that with their extended introduction amongst us, the occupations of the refinery exclusively, would be greatly lessened.

Hence we see the anomalous condition of things now existing. Two beet sugarine in successful operation, turning out the best quality of sugar known to the markets as granulated sugar, and supplying a large quantity daily, and lessening in a correspounding ratio the quantity required formerly from the refineries. And what do these refineries do, but put down the price of granulated sugar from two to three cents a pound below a fair value, and below what the same qualities of sugars are worth in New York.

Possibly the refineries backed by San Francisco capital may demolish this new industry, or make its working unprofitable, and having done so, put up price to the old figures or above all former precedent, just to show to consumers the *power* of *speculative capital*; as though California had not yet felt its grinding influence sufficiently for all practical purposes.

Cork-screw Growth.

We are indebted to A. D. Pryal, nurseryman and florist, of Oakland, for a half dozen samples of the *Eucalyptus viminalis*, grown from the seed planted in pots in March last. The trees are from 3 to 6 feet in hight, apparently healthy and luxuriant, notwithstanding the morbid growth and distorted condition of their roots, caused by being cramped up for a whole season and obliged to make their living or do the best they can in their pent up prison-house, a flower-pot six inches in depth.

It is the favorite method with tree growers to start in this manner for one season, this, one of the largest and most rapid growers among forest trees; but we would just as soon think of growing the apple or yellow locust in pots, for a year, as the eucalyptus. In the address of Mr. Pryal before the Oakland Farmers' Club, this subject is ably handled and ought to receive the attention of individuals and committees whose business it is to procure and plant our highways and public grounds with trees.

In the illustrations which we present, No 1 is the Eucalyptus grown in open ground from the seed, without removal or transplantation; the roots allowed to take their natural form and direction; and though it possesses a strong, heavy tap-root, it is just what nature or the tree wants, or it wouldn't grow it. It does used it, first as a powerful anchor or brace to hold the tree to its position as against high winds, and secondly to secure sufficient moisture for the tree in seasons of protracted drouth.

Illustration No. 2 is the same kind of tree grown in a pot since March last. The first effort of the tree is to strike its main root downward; this coming in contact with the bottom of the pot, the root above begins to kink, twist or do any way to extend itself, to increase its surface of spongiolee to meet the increasing demand for nutriment. To suppose that it will throw out a mass of fibrous roots and fill the pot is to suppose that it will do what the nature of the tree will not admit of, or not till it has first established itself in the soil, secure against wind and drouth.

The consequence is, that the root in the pot

Fig. I.

continues to enlarge, with hardly any increase of its length, until the coils actually touch each other, as shown in the cut, and unnatural excrescences as at A are also forced out above the real roots.

At length the root, in the illustration given —and which is true to life—found its way

Fig. II.

through the hole in the bottom of the pot opposite to B, and standing on the ground immediately commenced the formation of fibrous roots.

Now when this tree is transplanted it is set in the ground up to A, because all below that is real root, but a miserably distorted foundation for any tree to commence a growth upon, and with scarcely a rootlet for the first eight inches from the surface of the ground. Is it surprising that such trees never root naturally thereafter and that they are prostrated by the first high wind? Our article contains hints and suggestions that are worthy the attention of those who contemplate the setting of the new favorits, the Eucelyptus, in any of its varieties; and in the specimens before us nature presents a strong argument in support of our proposition, often inculcated, of planting the seeds of trees, if possible, in the places where they are to stand permanently.

Grains of Science.

[Written for the PRESS.]

Among the Birds, or Facts for Darwin.

The natural wants of most animals explain their habits. Habit denotes law. Voluntary motion denotes object. What that object is, is frequently less plain than the fact of it. Not a few of the manuvers of animals puzzle the beholder.

Mounds had their builders in genius men.

Fig. I.

Coral reefs by insects. Did you ever suspect birds were tree-planters?

During the past summer I saw a young oak tree a little over one foot in hight, in its second summer's growth. It was in the garden of Mrs. H., of Contra Costa County. She informed me she saw a blue jay (*garrulus cristatus*) plant the seed of that little oak. The bird came with the acorn and dug a hole in the soft earth near a bunch of pinks, two or three inches deep, put the acorn into the little pit, small

Fig. II.

end downwards, and drove it well into the ground, striking it with its beak as with a hammer. The stroke were strong, rapid and loud. The jay then carefully covered it with loose dirt and departed. My observing informant remarked she had often seen the blue jay plant acorns in different places about the garden, but had never noticed one return to recover the buried fruit.

We are accustomed to believe winds, floods, and water currents are the natural transporting agents of seeds, nuts and fruit buds. Here witness the beautiful jay, good creature, a benefactor to desolate plains. Trees encourage comfort and civilization. The blue jay anticipates both by planting trees. Did that bird work for itself, for man, or for posterity?

In Stanislaus County, Mr. Dicky gave me report of his observations that may explain the origin of dried meat. He had noticed a butcher-bird (*Lanius excubitor*) engaged in its remorseless pastime. This tiny bundle of cruelty in feathers is the guerilla of the air. Mr. Dicky saw one impale lizards, small snakes, crickets, and horned toads on the terminal spines of the century plant leaf and on the sharp points of limbs of trees. (See Fig. 1.) Soon each carcass became dry and hard, and swung with the fitful breeze to and fro, in small imitation—or suggestion it may be—of the vane to a spire. If he knocked off the transfixed specimens, in a few days others were replaced. Persistent research! Cut-throat industry! It contemplates death fate with vulgar satisfaction. The bird was never seen to resort to, or remove them for food. The sight of the slain seemed to nourish its taste for blood. Fear, revenge, or love of murder might prompt to kill; but to expose the helpless victims high in open view, is to hint at punishment after death, or at dried beef.

Woodpeckers dig holes in trees, and deposit acorns in them. (See Fig. 2.) Acorns are supposed to afford worms, which are of interest to woodpeckers. I saw specimens of old wood and thick oak bark—obtained in the vicinity of Stockton—having dozens of holes dug in them. Each hole contained one, sometimes two—not acorns—but smooth pebbles. The stones were nicely selected to fit the holes, and squeezed in so tightly as not to fall out, though the bark be turned with the openings upside-down. As you inspect the curious pieces, you decide it is the work of crude art and of native tools. Woodpeckers doubtless made the holes. For what? Not in search for worms, for there are no tortuous worm avenues, nor worm tracks, and none of the holes pass through the bark to reach the wood beneath. Why are pebbles stones placed there; by whom or what? Did the same creature that made the openings, pave them?

These questions are unimportant, but not uninteresting. They wait for solution. Yet do we not find them paralleled in the coarse instincts of humanity? The acorn planted by the jay may have been plundered and then concealed. The butcher-bird is probably not a fallen angel, but nature's exhibit of a compact genius of cruelty, and loves the trait. Magpies may have put stones in the artificial bread-baskets of oak bark, in place of acorns, as a joke on woodpeckers.

A. S. HUDSON, M. D.

Oakland, Nov. 25, 1872.

The Stanton Ruby.

On Wednesday last the cutting of the now famous "Stanton Ruby" was completed in this city, by the well-known lapidaries, Messrs. Laine & Cartiere.

The stone has necessarily been somewhat reduced in size since it has been subjected to the action of the emery wheel, but Messrs. M. & C. inform us that this specimen of a Spinel Ruby weighs as much as 13 carats in its present condition; it is of a deep blood-red color remarkably clear and free from flaws, only one small one being perceptible. The intrinsic value of the stone cannot well be computed, as a Spinel of the above weight and color, is worthy any fancy price a connoisseur may place on it.

Messrs. Laine & Cartiers estimate the value of this Spinel Ruby, at from $6,000 to $7,000.

THE VISALIA AND STOCKTON narrow-gauge railroad is gaining ground and subscriptions are said to be satisfactorily increasing. An unusual interest is being manifested in this class of roads all over this Coast which they will materially benefit.

QUICKSILVER.—One hundred and sixty tanks of quicksilver, weighing in the neighborhood of 16,000 pounds, were received in Virginia City from San Francisco on Monday last.

BUSY.—There is an immense freighting business from the end of the track of the Southern Utah roads, to southwestern Nevada, and the mining districts are crowded with teams.

Coal Fields and Golden Sands of Oregon.

At the last meeting of the California Academy of Sciences Mr. W. A. Goodyear, of the State Geological Survey, read a description of a trip through Oregon, in which he made some interesting remarks on the general geological features of the country, and referred to the coal fields, and the auriferous sands of Gold Bluff. We append an abstract of the paper:

The Overland Route.

After crossing the State line, on descending the northern slops of the Siskiyou mountains, in Oregon, we come to the little village of Ashland, on Bear Creek, a branch of the Rogue river. At this place I saw some marble tombstones, the material for which was said to have come from the Siskiyou mountains on the south. The valley of Bear Creek is underlaid by unaltered sandstones.

The mountains, which rise quite high on the north side, present every appearance, for many miles, of being also made up of unaltered sandstones and shales, beautifully stratified.

I saw nothing in Southern Oregon along this route which looked volcanic, excepting two or three flat-topped hills, a few miles northeast of Jacksonville, known as the "Table Rocks," and famous in Oregon as the locality of a desperate battle with the Indians in the early days. The capping of these hills is, in all probability, a table of basaltic lava.

Between the Rogue and the Umpqua rivers the country is very mountainous and heavily timbered. The road here crosses two prominent mountain ridges, descending at last to Canyonville, beyond which place it crosses the Umpqua River, along whose right bank it then continues to Roseberg. From here a newly constructed wagon road runs west sixty-three miles to Coos City, crossing the Coast Range of mountains at an altitude of 4,000 feet.

Coos Bay.

A peculiar feature of the country about Coos Bay is the numerous tide water sloughs, which stretch far inland to distances ranging from ten to thirty miles from the coast. All the lower part of the Coquille River is a tide water stream of this kind, and Coos Bay itself has half a dozen arms through which the tide ebbs and flows for miles back into the country in all directions.

So far as yet known, there is not more than one workable bed of coal in the Coos Bay coal region. The new mine recently opened by Messrs. Hardy and Goodale, on the north of the Bay, is undoubtedly on the same bed as the Eastport and Newport mines to the south. Nevertheless, the coal-field about Coos Bay is very extensive, reaching certainly from the coast, ten or twelve miles back, and from the Bay south to the Coquille river, and north as far as the Umpqua. Coal of good quality is reported on the North Umpqua east of the coast range of mountains. It is needless to say, however, that in a region so cut up by gulches, the portion of this broad area which is covered by coal of good quality and workable thickness, is comparatively small. In fact, there is no coal here which it will pay to work for many years to come, except that which is situated in close proximity to the shores of Coos Bay.

The coal bed here consists of two strata, each from two to two and a half feet in thickness, separated by a stratum of clay rock, from six inches to a foot thick. Above the upper layer of workable coal is another stratum of rather hard clay rock, from a foot to eighteen inches thick, and over this again another stratum of coal of nearly equal thickness. But this upper layer of coal, though generally of good quality in the Eastport and Newport mines, is not worked.

The Quality of Coos Bay Coal,

As compared with that of the Mount Diablo mines, is better for some purposes, and for others not so good. For domestic use it is preferred to the Mount Diablo as it does not crumble quite so badly in the fire as the latter coal and consequently makes rather a freer and open-burning fire. It is also often said that the odor of the Coos Bay coal is less offensive than that of the Mount Diablo coal. But this is a statement in which there seems to be more of fancy than of truth.

For steam purposes, the evidence of chemical analysis goes to show that the Coos Bay coal is not worth quite so much per ton, as the Mount Diablo coal. This fact appears to be chiefly due to the somewhat larger percentage of water which the Coos Bay coal contains, and which not only diminishes by an amount equal to its own weight the heat-producing substance of the coal, but also requires a considerable quantity of heat for its own volatilization. In the Coos Bay coal, the texture of the wood from which it was formed is often beautifully preserved. Several of these facts, as well as some facts in the physical and geological features of the country itself, point to a probability that the Coos Bay coal is of somewhat more recent formation than the Mount Diablo beds. Before leaving Coos Bay, I visited the site of

The Old Town of Randolph.

Now deserted, on the mouth of Whisky Run, a small Creek which enters the ocean some four miles north of the Coquille river. The surface of the country from Whisky Run to the Coquille river for a mile or so back from the coast, consists of low, rolling hills of sand and gravel, covered with a thin soil which supports a scanty growth of grass and scattering trees. These hills front the sea in a continuous line of bluff. The sands of the beach along the foot of this bluff for three or four miles to the south of Whisky Run have been in the past extensively worked for gold, and are said to have been very rich. It was this beach mining that gave rise to the town of Randolph, and that alone supported it as long as it continued to exist. The working was carried on chiefly with the shovel and Long Tom.

The Gold Sand

Was uniformly very fine; no single nuggets having ever been found of more than four or five cents in value. It was impossible, of course, to save all the gold. The loss in the tailings was constant and heavy, and a considerable portion of the ground here is said to have been worked over six or seven times in succession, paying well each time. The locality at, and immediately south of Whisky Run is said to have been enormously rich; and it is stated that for a little while it was no rare thing for a single miner to take out a thousand dollars worth of this fine gold dust in a day.

My informant upon many points relating to the history of this work was F. G. Lockhart, who has been in this country some 18 or 20 years, and is thoroughly familiar with it. He is now engaged in working a "black sand" mine, at a different locality, of which I shall presently speak. He tells me that the productive stratum along this beach was a layer of "black sand," from 1 to 2 feet in thickness, generally buried from two to five feet deep beneath an accumulation of lighter sand. But this last accumulation appears to be a transient thing, as the action of the wind and waves on this beach varies greatly at different seasons—sometimes casting up large quantities of sand, and again sweeping it all away, so that the surface of the beach is constantly changing, and is at some times five or six feet higher than it is at others. It thus appears probable that the auriferous stratum of "black sand" lies at the bottom, and forms the floor of what may be called the *zone* of perpetual change of the beach. It is also said to have covered the whole width of the beach from the very base of the bluff, as far out beneath the waves as it has ever been possible to carry explorations at the lowest tides.

It has long been a popular belief, and is still the opinion of many, that this "black sand" together with the gold which it contains, have come from the depths of the sea, having been simply cast up by the action of the waves upon the beach. But such, in my opinion, is not the fact. I know of no argument in favor of such an idea beyond the simple fact that these sands are found upon the beach; while there is a strong *a priori* argument against its probability in the high specific gravity of the "black sand" itself as well as the gold, and in the fact that the heaviest materials are not those which waves most readily throw up upon a beach.

There is no difficulty here in pointing the finger at once to a perfectly adequate source for all the gold without going to sea to hunt for it. In the first place, there is no difficulty with the pan and shovel in finding the "color" of gold, not only throughout the material which forms the face of the bluff that fronts the beach but also almost anywhere on the surface of the low rolling hills stretching backward from the bluff, and in the second place, there is plenty of evidence that the whole front of the bluff itself is wasting away with comparative rapidity by the action of the waves and storms.

The Beach Receding.

At one point I saw in the sands of the beach, the stump of a tree six or seven feet in diameter, evidently where it grew, the wood but partially carbonized, the fibre brown and soft, though still rather tough and exactly resembling in character the woody fibre in a bed of incipient lignite, or half carbonized vegetable matter two or three feet thick, which crops out for a long distance, in the face of the bluff, a few feet only above the level of the beach, and buried under from 30 to 50 feet of the half consolidated sand and fine gravel which forms the upper part of the bluff. Mr. Lockhart states that when he first saw the stump, 18 or 20 years ago, it was about half covered up by the foot of the bluff; now the foot of the bluff is at least 20 feet from the centre of the stump.

At this point, when the tide is low, the tops of a number of other stumps may be seen, still standing upright where they grew, but ordinarily covered with water now, and some of them a hundred yards or more outside of present mean low water line.

A "Black Sand" Mine,

Which Mr. Lockhart is now working, is not on the present beach at all, but is back in the timbered country, two or three miles southeast, from the mouth of Whiskey Run, and 190 feet above sea level. This hight of a former beach above the sea is another indication of the comparatively recent changes of level here.

In opening a tail-race from his mine to the sea, Mr. Lockhart has made, with the aid of water, a cut half or three-quarters of a mile in length, and from 25 to 40 feet deep, straight through the low, rolling hills that border the shore, thus exhibiting a fine section of their structure. Here, as well as in the bluffs along the beach, they are seen to consist of alternating beds of sand and fine gravel, lying everywhere nearly horizontal. Sticks and logs are not uncommon scattered through the mass, and in the cut some trees have been unearthed still standing where they grew. Two or three large stumps still remained upright in place at the time of my visit, with their roots about forty feet beneath the present surface of the hills, and with their woody fibre in the same condition as that in the bed of half-formed lignite, which crops in the bluff along the beach.

I was shown a human skull, probably that of an Indian woman, which was found some years ago in the bluff itself, about ten or twelve feet beneath the top, and under several feet in thickness of the fine gravel deposit which helps so largely to make up this formation. The skull has evidently been long buried, but it might possibly have been covered by a slide, and I have little faith that it is really so old as the gravel of these hills.

Colonel Lane states that in his mine the "black sand," so far as worked, has averaged from 5 to 6 feet thick. There is more or less fine gold scattered all through this sand, and also some platinum, mingled with more or less iridosmine.

The Difficulty of Saving Gold

From the "black sand" appears to be due chiefly to two causes; to its fineness, which permits it to be so readily washed away by a stream of running water; and from the fact that a portion of it seems to be coated with a substance which protects it from the action of the mercury. It is not so clear of what this film consists. Mr. Wright, who owns a "black sand" mine north of Lockhart's, thinks that in his mine it consists chiefly of organic matter, perhaps of bituminous oils. He burns his sand in heaps before amalgamating it, so that it is exposed to a high degree of heat for several hours. He then works it in an arastra, and by this treatment he obtained two or three times as much gold as he could without the burning.

At the time of my visit, Mr. Lockhart was making preparations to apply on a large scale, Plattner's Chlorination Process, to extract the gold from these "black sands."

With this material, no expensive preliminary roasting will be required, and if the chlorine will dissolve with sufficient rapidity gold which is as coarse as this, I see no reason why it may not prove a complete success in the extraction of gold. The experiment is well worth trying, and it will be interesting to know the results which he obtains.

Volcanic Formations.

I left Coos Bay on the 9th of November for Portland. Between Roseburg and the head of the Willamette Valley, I noticed considerable unaltered rock, both shales and sandstones in various railroad cuts.

I saw nothing that I could recognize as volcanic, till I reached the vicinity of Albany, where the gravel used in ballasting the road, contains volcanic pebbles.

Some 25 or 30 miles before reaching Portland, we struck the basaltic bluffs, on the right bank of the Willamette river, and from that time forward, I saw no rocks except volcanic till after I left Portland for San Francisco.

I will not attempt to describe the magnificent cañon of the Columbia river, through the Cascade Mountains between Portland and the Dalles, so familiar to all travelers in Oregon. I will only direct attention for a moment to one most striking contrast between the character of the volcanic matter here, and that on the western slope of the Sierra Nevada, in California. The Cascade Mountains, where the Columbia cuts through them, appear to be entirely made up of a series of superimposed sheets of lava, which, when it flowed, ran not into narrow streams, but spread its fiery floods both far and wide in all directions over the then smooth or nearly level, or very gently sloping country. They, therefore, consist to-day of terraces of solid compact rock from base to summit, and the quantity of breccias or fragmentary materials of any kind, is comparatively so small as to be hardly noticed.

The western slope of the Sierra Nevada, on the contrary shows its volcanic matter, almost exclusively in fragmentary forms. Beds of ashes, breccias and volcanic gravels and conglomerates are everywhere; but lava-flows are few and far between.

This is true especially in the central portion of the State. But throughout the central and southeastern portion of the Sierra there is, so far as I know, on the western slope, but one great lava-flow,—the Tuolumne county Table Mountain. Moreover, the total quantity of volcanic matter in the mining countries of the Sierra Nevada is utterly insignificant compared with the vast accumulations that have built up the Cascade range. The absolute quantity in the Sierra is indeed great. But that in the Cascade Mountains is more than great; it is stupendous.

The Great Peaks of Oregon.

I am tempted to add a few words about the view of Mount Hood, Mount Adams and Mount St. Helen's, which I obtained from the hills just back of Portland the morning after my return from the Dalles.

The weather, which had been stormy for several days, cleared up during the night, and that morning the air was full of a depth of purity and transparency, such as it only has on the higher mountains, at rarest intervals and after storms.

Those who have seen Mount Hood and Mount St. Helen's, know that both of them rise, like Shasta, towering, solitary and sublime, 5,000 or 6,000 feet above everything else around them. Mount Adams is said to rise in a similar way, and Mount Rainier is even grander still. But Mount Rainer is not in sight from here, being nearly in line with, and probably hidden by, Mount St. Helen's. The base and the greater portion of the mass of Mount Adams were also hidden by some high mountains which rise between, but its snow-clad summit rose clean and high over all in the distance and sharply cut against the deep blue heavens.

Yet the beauty and the majesty were in Mount Hood and Mount St. Helen's. These stood revealed in all their outlines, but robed from base to crest in virgin snow, as pure and white as only freshest snow can be in sunlight such as this. The lower mountains and the forests far around the base of Hood were also white with snow, and here and there a rocky spur protruded from the snow high up the steep slopes of the peak itself.

But up to the very foot of St. Helen's swept the dark forests, without a speck of whiteness, and from their deep shades she rose in sharp-cut, solitary majesty, the most symmetrical volcanic cone I ever saw, lifting her head to heaven, without a spot in all her robe of white—grand in her lonely altitude, unrivalled in stately beauty, and clothed in rare and radiant glory by the sunlight and the snow.

The Mount Lincoln Silver Mines.

Are nearly deserted for the Winter. Only one man is left at the town of Quartzville, and about twenty men at the mines above. About a dozen men are also staying at Buckskin and Dudleyville. Dudley & Peters' furnaces were to start up on Saturday last, and they think they have ore enough on hand to last them until Spring opens. They have some 200 tons of first-class ore from the Moose mine, estimated to be worth from $400 to $500 per ton, besides many smaller lots from other mines in the immediate vicinity. Seven men are wintering at Breckenbridge, and about as many more in the smaller mining camps in the vicinity. Some four or five are also hibernating at Hamilton. Fairplay has also assumed its usual Winter quiet, but we look for lively times, and a big bullion yield from that region next season. About twenty-five men are employed in the mines at St. John's and Montezuma, in Snake River, but no mill is running in the District. A run made some time since, at the Boston S. M. Association's mill, we understand, was not very highly satisfactory. One hundred tons of ore as it came from the mine, was concentrated in the mill, producing about seven tons of smelting galena, which after smelting, gave a little over four tons of pig lead, worth, by assay, 130 ounces silver per ton. Besides this, they got about ten tons of amalgamating ore, estimated to be worth 30 ounces per ton. As a total result, we have in the 100 tons of ore, silver $676—amalgamating ore $390, and lead at $4 per 100 lbs—a very liberal price at the works—$320; total, $1,386, or $13.86 per ton. The ore as it comes from the mine undressed, is reported to be worth in silver alone, $30 to $35 per ton, showing a big loss somewhere—probably in concentrating. The ore carries a small per cent. of copper and zinc blende, ores that carry a much larger per cent. of silver than galena, the predominating ore of the mine. The gangue is a heavy spar (sulphate of baryta) principally, the specific gravity of which is higher than that of zinc blende, and nearly equal to that of gray copper, which renders it very difficult to separate by the process adopted at that mill, a fact that probably accounts for a portion at least, of the loss, the most of the silver having been washed out and lost with the tailings.

In fact, we have been reliably informed, that an employé of the mill took up a sample of tailings below the mill, which he assayed and found it to be richer in silver than the concentrated ore saved in the mill. This fact he reported to the Superintendent and *was discharged* for his zeal in looking after the interests of the Association, in a line out of that for which he was employed. Better results are looked for from the St. Lawrence mill, which is to be started up early next season. It is to be operated on a different, and most metallurgists think, better plan for that class of ore. They have a good mine and mill, and the management is intelligent and economical—good guarantees for success.—*Colorado Register.*

Mining in British Columbia.—The Cariboo *Sentinel* publishes the following: The Ballarat, William Creek, washed up forty ounces for three days' work. The Point Company, Lightning Creek, washed up 220 ounces, and 120 ounces for one week's work; ground improving in appearance. The Eleven of England are waiting for their pumps, and taking out about expenses. On Antler Creek the Eureka Company have found gold in the channel which they are prospecting. They are now fixing up for the winter's operations. The Perseverance Company, on Harvey Creek, continues taking out pay, but have still many large boulders to contend with. Keithly Creek has paid better this season than it has done for the last five years. The Clydesdale Company has paid considerably over expenses. The White Squall Company has also taken out good pay. The Discovery and Two Sisters Companies, Jack of Clubs Creek, are taking out good pay. The latter company has been finding very heavy coarse gold. The Two Brothers Company have bottomed their blind shaft at thirty feet, and found smooth bed-rock with sediment and gravel—bed-rock dipping to the westward. This company has now let a contract to J. Pomeroy to sink a shaft 100 feet in depth over a spot where the indications show the existence of the channel.

Scientific Progress.

A New Theory for Volcanoes and Earthquakes.

There are few things less satisfactorily accounted for than the phenomona connected with volcanoes and earthquakes. The chemical theory; the theory of a molten interior; the theory of isolated subterranean lakes of molten matter, and lastly the electrical theory, have each had their advocates, but have all failed to meet the conditions required to establish them on anything like a scientific basis. But a new theory has recently been brought forward by Mr. Robert Mallet, a scientist, who has long made the phenomena of volcanoes and earthquakes his special study, and whose publications upon these subjects have obtained much favor from the scientific world. This theory seems quite competent to explain most, if not all the facts which have hitherto appeared most perplexing. His theory has been put forth substantially as follows:—

It is recognized by physicists that our earth is gradually parting with its heat. As it cools it contracts. Now, if this process of contraction took place uniformly no subterranean action would result. But if the interior contracts more quickly than the crust, the latter must in some way or other force its way down to the retreating nucleus. Mr. Mallet shows that the hotter internal portion must contract faster than the relatively cool crust; and then he shows that the shrinkage of the crust is competent to occasion all the known phenomena of volcanic action. In the distant ages when the earth was still fashioning, the shrinkage produced the *irregularities of level* which we recognize in the elevation of the land and the depression of the ocean-bed. Finally, as the globe gradually lost its extremely high temperature, the continuance of the same process of shrinkage led no longer to the formation of ridge and table-lands, but to local crushing-down and dislocation. This process is still going on, and Mr. Mallet not only recognizes here the origin of earthquakes and of the changes of level now in progress, but the true cause of volcanic heat.

The modern theory of heat as a form of motion here comes into play. As the solid crust closes in upon the shrinking nucleus, the work expended in crushing down and dislocating the parts of the crust is transformed into heat, by which, at the places where the process goes on with greatest energy, "the material of the rock so crushed and of that adjacent to it are heated even to fusion. The access of water to such points determines volcanic eruption."

Now, all this is not mere theorising. Mr. Mallet does not come before the scientific world with an ingenious speculation, which may or may not be confirmed by observation and experiment. He has measured and weighed the forces of which he speaks. He is able to tell precisely what proportion of the actual energy which must be developsd as the earth contracts is necessary for the production of observed volcanic phenomena. He is able to show, by calculations which cannot be disputed that less than one-fourth of the heat at present annually lost by the earth is sufficient to account for the total annual volcanic action, according to the best data at present in our possession.

It is worthy of notice, that Mr. Mallet's theory of volcanic energy is completely opposed to ordinary ideas respecting earthquakes and volcanoes. We have been accustomed vaguely to regard these phenomena as due to the eruptive, outbursting power of the earth's interior; we shall now have to consider them as due to the subsidence and shrinkage of the earth's exterior. Mountains have not been upheaved, but valleys have sunk down. And in another respect the new theory tends to modify views which have been generally entertained in recent times.

Our most eminent geologists have taught that the earth's internal forces may be as active now as in the epochs when the mountain ranges were formed. But Mr. Mallet's theory tends to show that the volcanic energy of the earth is a declining force. Its chief action had already been exerted when mountains began to be formed; what remains now is but the minutest fraction of the volcanic energy of the mountain-forming era; and each year, as the earth parts with more and more of its internal heat, the sources of her subterranean energy are more and more exhausted. The thought once entertained by astronomers, that the earth might explode like a bomb, her scattered fragments producing a ring of bodies resembling the zone of asteroids, seems further than ever from probability; if ever there was any danger of such a catastrophe, the danger has long since passed away.

Bisulphide of Carbon for Extracting Oils. F. Fischer states that in Gottschald's oil factory where 30,000 cwt. of oil seed are extracted, the workman do not suffer from headaches, and that in extracting 100 kilos. of seed only half a kilo. of the bisulphide is lost. Even this loss he thinks is due to decomposition, the sulphur set free attacking the vessels, especially those of copper.

Telegraphing by Sound through Water.

In 1828 Strum and Colladon made a series of experiments at Lake Geneva. Switzerland, to determine the rate of transmission of sound through water. The sounds were produced by striking a bell suspended from a boat at a suitable depth in the water, while the observers were stationed in another boat at a distance and received the sonorous impressions through a long metallic tube, the lower end of which was closed by a membrane and immersed at a considerable depth in the water. In these experiments the bell weighed about one hundred and thirty pounds, and the sound was heard at a distance of about 14,000 yards.

During the recent siege of Paris the attempt was made to obtain telegraphic communication with the provinces by the device of transmission of sound through water, and the Minister of Public Works confided the necessary experiments to M. Lucas, who reports the following results; The experiments were conducted as in the former instance and made in the River Seine. Two bells were employed, one of about eighty pounds and the other of seven hundred pounds weight. In the case of the first the sound was transmitted to a distance of about 1,800 yards, while in the case of the second or larger bell only to 1,500 yards. There was therefore no advantage gained by the increase in the size of the bell—in fact there was a loss. The great diminution in the distance to which the sound was conveyed in his experiments is accredited by M. Lucas to want of depth in the waters of the Seine as compared with those of Lake Geneva.—*Scribner's for December.*

Density of the Supposed Resisting Medium in Space.—The density of the supposed resisting medium in space is computed to be such that it would support a column of mercury less than the two hundred and twenty million-million-millionth of an inch high. [A fraction expressed by 220 for a numerator and 1 followed by eighteen naughts as a denominator.] This rarity of the ether comes out so great that the figures fail to convey any definite idea to the mind, and we must have recourse to illustration to bring out their significance. A man inhales on an average twenty cubic inches of air at each breath, or, in other words, a quantity of air equal in bulk to an apple three and a third inches in diameter; but if the density of the air were attenuated to that of the ether, he would be obliged to take into his lungs at each inspiration a bulk of it equivalent to a sphere of not less than fifteen and probably one hundred and seventeen miles in diameter. This of course indicates merely the probable *order* of the density of the ether.

Spontaneous Decomposition of an Alloy of Lead.—It appears that, among a collection of coins and medals belonging to the University of Munich, there are preserved some copies of medals and coins made of a soft alloy—bismuth and lead—which was found to consist (when unaltered) of various proportions of the metals alluded to, namely: 1st, Lead, 66; bismuth, 34; 2d, Lead, 86; bismuth, 14; 3d, Lead, 88; bismuth, 12. It is apparent that these alloys were not all made at the same time; in some instances, the medals cast in these alloys had not only become somewhat oxidized but had even fallen to powder, which effervesced on being treated with acetic acid, and the solution was found to contain chiefly lead, but bismuth was also present. Dr. Vogel observes that it is rather curious that alloys kept in well-closed show cases should have become thus altered and deteriorated; the cause is ascribed to the tendency of bismuth to crystallize, whereby a molecular change is first effected, and thus oxidation is rendered more easy.

Luminous Meteors.—Prof. Herschel, during a discussion at the late meeting of the British Association, on the subject of luminous meteors, remarked that the November "shower" meteors seemed to move in an elliptical orbit, similar to that followed by certain comets, and that they have probably been drawn from space and compelled to assume such an orbit by the attraction of the sun. He said that the most of the occasional meteors were too small to pass through the earth's atmosphere, without being dissipated by friction in the air, although now and then one of exceptionally large dimensions would reach the ground, and sometimes fatal accidents had been caused thereby.

Metals from the Soot of Coals.—H. Reinsch states that, while testing some soot collected in a stovepipe, he perceived the smell of arsenic; this gave rise to further experiments, the result of which showed that the soot contained iron, manganese, copper, arsenic, potassa, soda and lime, in considerable quantities. The coal which yielded this soot is that found at Zwickau, Saxony.

Underground Temperatures.—We have already stated the fact that Father Secchi has undertaken to conduct a series of experiments on underground temperatures at the Mt. Cenis Tunnel. We now see it stated that instruments similar to those to be used by Father Secchi will be furnished to the Smithsonian Institute, for similar observations in the great tunnel which is now being cut through the Hoosac Mountains in Mass., as well as to observers at Ballarat, Moscow, St. Petersburg and Paris, at which localities explorations are being made in the sub-wealden rock. Observations of much value are expected from these distant localities.

Mechanical Progress.

The Life and Wear of Rails.

It is impossible to estimate the life of rails. Out of 12,000 tons recently laid on the Boston and Albany railway, 8,000 tons had to be removed in about one year. Under favorable conditions, *good iron* will last eight years under the average traffic of a first-class road, but with the material commonly employed, from three to six years, and sometimes less is all that can be counted upon. Fast-moving trains wear out rails much more rapidly than those running slow—the difference is estimated as two to one. The wear is greatest where the bulk of the traffic falls upon the down-grades. In one instance, a mixed traffic of 62,390 trains very nearly wore out the best rails on a 40-ft. descending grade in 7½ years; while the same description of rails upon a level grade, withstood the passage of 203,122 trains. For equal amount of traffic, the wear of rails is assumed to be as the square of the speed.

The iron first used upon English roads stood from 15 to 20 years, even under an enormous traffic; no such rails are now made, unless of steel. In 1840, it was estimated, upon the London and Northwestern Railway, that the passage of 313,000 trains would wear out a 70-pound rail. With the material now put into rails, no such service is obtained. Mr. Price Williams states that the best quality of rails, as now made, will not stand the passage of over 100,000 trains. The difficulty does not seem to be so much in the impossibility of making good and serviceable iron rails, as in the fact that few are made. In this respect the same facts hold good as has been frequently referred to in the manufacture, during late years, of nearly all classes of iron work.

With regard to the life of steel rails, every thing here again depends upon the quality of the metal. A pair of 21-ft. Bessemer steel rails, upon the London and Northwestern Railway, outlasted sixteen faces of iron rails, being evenly worn to a depth of a little over a quarter of an inch; having in about three years sustained the traffic of upward of 500,000 trains. This particular pair of rails was finally destroyed by a locomotive running off the track, the wheels striking the rails transversely and badly bending and breaking them. It was estimated that they would have endured at least one-half as much more traffic but for the accident.

So, too, upon the Philadelphia, Wilmington and Baltimore Railway, a good steel rail has outlasted sixteen iron rails, the use of both being the same, and on many other roads of large traffic the same successful results have been achieved. Railway managers have got to exercise more care and discrimination in the quality of the rails they purchase, whether made of iron or steel. In fact, there is a good amount of pretty miserable stuff sold for steel rails, as many of our managers know to their cost.—*Condensed from Railroad Times.*

Monster Derrick. — Some months since, the Delamater Iron Works constructed, a 100-ton floating derrick, which is now in successful operation, and is the most powerful structure of its kind in the world. It was constructed for the purpose of transporting and laying under water the huge monolyths of artificial stone or béton which form the lower part of the river wall which is to surround the water-front of the city, and has a lifting power of upwards of 100 tons. The float which carries the derrick is of rectangular form, 66 by 71 ft., and 13 ft. in depth. It is put together in the strongest manner, in order that it may stand, without twisting, the heavy loads it carries on its deck, as well as the strain caused by the great weights which are lifted by its boom. The tower, which is placed upon the float, and which carries the derrick proper, consists of a king-post supported by 12 legs or braces of Georgia pine, 63 ft. 3 in. in length, and 14 in. square, stiffened from one end to the other by struts and braces; their lower ends are bolted into a heavy, cast-iron circle, which, in its turn, is held down by numerous bolts, which pass down through the bottom of the float. At their upper extremity, these legs are brought close together and inserted into a heavy cast-iron cap, to which they are bolted. The tower thus described accordingly forms a frustrum of a cone 40 ft. in diameter at the base, 62 ft. in height, and 12 ft. in diameter at the top. The cast-iron cap which surmounts it is made with a circular hole, through which the king-post passes.

Patents in Japan.—Mr. Mori, the Japanese minister at Washington, has been making particular enquiries with regard to the American patent system, and expressed the hope that he may be able to prevail upon his Government to introduce a liberal patent system into Japan—one that would stimulate the skill and industry of the people. In view of the intelligent and progressive spirit shown by this people, such a policy would be of much advantage to our inventors and mechanics.

Iron Buildings.—The *American Manufacturer* says: "It would be difficult to trace back and fix the date of the earliest employment of iron in house structure. Certain portions of buildings, such as beams, supporting columns, and pillars, have been used exclusively for many years, both abroad and at home; but the idea of constructing a building, of which the whole external frame work should be in this material, is, we believe, an American one, originating with, and first practically accomplished by Mr. James Bogardus, of New York. To the best of our knowledge, the first building in this country or elsewhere, having front and rear of iron, was erected in the city of New York, and occupied as a business place by this gentleman about the year 1844. In spite of many adverse criticisms and prophesies of the impracticability and failure of his plan, Mr. Bogardus, shortly after the erection of his first building, entered definitely into the business of erecting iron buildings, and from the realization of his earliest attempt, succeeded shortly in establishing upon a firm, practical basis a branch of industry, which has now grown to colossal dimensions, and in really inaugurating what has since developed into a revolution in the construction of large buildings for business or other purposes, designed to be secure against fire.

Wrought Iron Tubes.—Heretofore wrought iron tubes have not been produced except at high price, on account of the tedious and expensive way of making it. Costing from 200 to 1,000 per cent. more than solid iron, according to weight of tube, it could not be made to take the place of solid iron, from the fact that such iron, though twice the weight, was less expensive. It is well understood by every engineer that a properly-proportioned tube is stronger and safer, under vibratory strain, than a solid bar. Therefore the great desideratum was how to produce a cheap tube in wrought metal. After years of study, and experiments innumerable, a process is said to have been discovered by Elbridge Wheeler, of the American Tubular Iron and Steel Association, of Philadelphia, so simple that there remains no doubt of its ultimate success. By this process, hollow objects in iron, in steel, and steel and iron combined, can be produced, such as car axles, marine shafts, and bridge columns, with varying diameter in the same tube, which cannot be accomplished by any other process.

A New Kind of Flint Glass.—Dr. Benrath, director of the glass-works at Dorpat, Russia, publishes an account of experiments made by him to introduce a glass which has the good qualities of flint glass without its defects. The good qualities of ordinary flint glass are, that it is as clear as crystal; that it has a high specific gravity (is heavy); a low fusing point, so that it melts easily; and strong power of refraction and dispersing light. It is, therefore, invaluable for chemical and optical purposes. Its defects, however, are, that it is easily acted on by chemical and mechanical influences—that means, it cannot stand rain and sunshine, much less acids or boiling water, and is so soft that it is most easily scratched. The chemical difference between ordinary and flint is that the former consists of silex, lime, and soda or potash, while oxyde of lead is added to make flint glass out of it.

Boiler Scale. — Many substances are employed for the purpose of preventing the formation of scale in boilers. Among these, some act chemically, as soda ash, chloride of barium, carbonate of ammonia, chloride of ammonia and tannin, or extract of oak bark. Saw-dust from mahogany and from the wood of cone-bearing trees acts in part mechanically, but the slime it produces in the boiler often passes over into the valve-chambers and cylinders, and causes serious trouble. Clay, free from sand is said to have been used with success, but it also at times passes over into the cylinder. Starch and potatoes have been used for a long time, and now molasses is recommended. Dye-wood extracts, bran and chicory act by the starch and glucose they contain. Fats and tar are also used, but many deny their efficiency.—*Scribner's.*

Mechanical Invention.—The wonderful progress developed by the inventive genius of this country is noticeably attracting foreign interest. The London *Times* states that the attention of Professor Pepper, during his visit to the United States, will be directed to the "great recent development of mechanical and inventive ingenuity among their citizens, a development which has its gage in the extraordinary number of American patents which have been taken out during the last few years. A succinct history of the inventions of a given period would doubtless throw much light upon the other aspects of its civilization; and something like this is contemplated by Professor Pepper, as the ultimate result of his travels."

American Engineers.—Col. J. G. Medley, of the Royal (British) Engineers, and author of the "Roorkee Treaties on Civil Engineering" has recently been examining the engineering works of this country, with a view to the application of American methods in professional work to the East India improvements. He returns to India, carrying with him most favorable impressions in regard to the character of our internal improvements, and speaks enthusiastically of our technical schools. We can but feel a just pride and pleasure at such evidence of our credible engineering and scientific progress, particularly when it is presented by one so well known as a professional engineer.

S. F. Stock and Exchange Board.

THURSDAY, Dec. 12th, 1872.

Stocks were dull all the first part of the week but toward the cloee evinced evidence of an improvement both in businees and pricee. It ie ahout time that they did, for the market hae been exceedingly dull for some time. Dividende are a little more numerous this month then last. Meadow Valley pays $60,000 or $1 per ehare for the first time since June 20th. A surplue of $60,000 is also carried overe, qual to another dividend of a like amount.

The Eureka (Graes Valley pays $1 per share —$20,000. The Raymond & Ely mine paye thie month only $5 or $150,000, instead of $7 per share, or $210,000 as has heen the case for a long time past. The Eeetport Coos Bay Coal Co. peys $5 per share—$,2500. No dividends from the Crown Point or Belcher thie month, although the report of the latter is favorahle for next month, for they have $700,000 on hand; the receipts for Novemher were $556,000. The North Star mine will pay no dividend this month as was expected, the Superintendent having drawn for $9,000, after having sent down $5,300.

Aesessments have not been as numerous this week ae usual of late.

On Friday the market was weak at low pricee, Belcher however, rose $2; Gould & Curry, $5; Yellow Jacket, $4; Ophir, $1; Eureka Con., $1; Meadow Valley, $1; Overman, fell $4 and Hale & Norcross the eame,

Saturday there was a elight improvement in prices and a feir husinees wae done, much hetter than hee usually been the case of late.

Monday, e tocks were dull egein, Belcher rose $1; and Cone. Virginia $2; Chollar fell $8; Caledonia, $3; Empire Mill, $1; Eureka Con., $1; Imperial, $1.50; Meadow Valley, 25 cents; Raymond & Ely, $4; Savage, $3.50; Jacket, $9.

Tueeday stocke were still dull and heavy, and pricee dropped generally. Belcher, $3; Crown Point, $4; Chollar, $6; Caledonia, $2; Imperial, $1; Eureka Con, $1; Savage, $2; Jacket, $6; Reymond & Ely, $2.

Wednesday the market showed greater strength, and it wae evident that pricee had touched hottom, Belcher rose $1; Chollar, $4; Empire Mill, $1; Gould & Curry, $5; Caledonia, $1; Reymond & Ely, $10; Jacket, $9; Meadow Valley, $1. Crown Point cloeed $3 higher than in the morning.

To-day the market was comparatively brisk, and a elight advance wae evident.

Below will be found newe from the prominent mines, later than that in our mining summary.

RAYMOND & ELY.—On the 5th inst., $36,437 was shipped; on the 9th, $31,290 wae shipped; previous to last, $60,429.67 had been ehipped, making a total for eight days of $91,716.67, equal to $11,464.96 per dey. A $5 dividend was paid thie month, instead of the $7 as nsual.

HALE & NORCROSS.—For the week ending Dec. 7th, 980 tons of ore were extracted, 1,117 eent to mills, and 1,134 tons remain on dumpe.

SAVAGE.—For week ending Dec. 7th, 775 tons of ore were extracted, assaying $29.68 per ton; 940 tons were sent to mill. and 155 tons are on the dump.

PHŒNIX.—On the 4th., 10 tons of hullion were shipped, asseying $285.85 per ton; on the 6th, 10 tons, assaying $234.01; on the 7th, 10 tons, assaying $239.12 per ton.

BUCKEYE.—During week ending Dec 7th, 125 tons of ore were taken out, assaying $22.40 per ton.

EUREKA.—Last weekly clean up was 1,300 ounces for 6 days run of 10 stamps.

BELCHER.—The total receipts for November were $556,000; expenses, $212.000; cash ou hend $700,000.

PEAVINE.—On the 7th $3,248 wae eent down.

Pulp assays from the PEAVINE are $108 per ton. Average asseys of ore from the AMADOR TUNNEL is $300 per ton. On the 10th, 550 ouncee of bullion were received from the CEDERBERG, from 12 daye' run at the mill. The EMPIRE (Idaho) sent down $2,750 on the 10th. From the Chief of the Hill $2,098.81 wae sent down on the 6th. Three furnaces of the EUREKA CONSOLIDATED are running well.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the minee mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—Alpine *Chronicle*, Nov. 30: In a few days the carpentere will he traneferred from the I X L and Exchequer mines to the Exchequer Mille. Vigorous work will he institnted for the completion of quartz mill. The hlacksmith shop ie to he removed and on its site ie to be erected a 90 ft. ore honse, to be connected with the mill by a tramway about 150 ft. in length. The boerding house is to he removed to another site to make room for e double extension of the saw mill; the rear of the mill is to he excavated, and the hank of the creek walled, for an immenee basin to hold tailings; the flume ie to he extended to a point where an additional fall of 12 ft. will be obtained; another Turbine is to be added, giving a 200 horse power, exclusive of the engine.

AMADOR COUNTY.

BACON.—Amador *Dispatch*, Dec. 7: The new "whim" is completed and iu running order and everything ie progressing finely. A contract has been let for sinking a shaft 100 ft. deeper.

CALAVERAS COUNTY.

SHAW CLAIM.—Caleveras *Chronicle*, Dec. 7: Washing has been commeuced.

HUDSON.—The sheft ie cleaned out to the depth of 100 ft.

STICKLE.—Calaveras *Citizen*, Dec. 7: The Stickle Co., at Angele, have their new building erected, and are prepering to erect new hoisting works.

FRESNO COUNTY.

SAN BENITO QUICKSILVER MINE.—Fresno *Expositor*, Dec. 4: The Co. owne 4 ledges of 3,000 ft. each, all of which have been pertially prospected, with most satisfactory results, large hodies of excellent ore heing discloeed. An English Co. has recently purchased a controlling interest with a view to working them extensively. It bids fair to be a very rich and extensive mine.

INYO COUNTY.

BENTON.—Inyo *Independent*, Nov. 30: Leete's new mill started up a few weeks ago; $5,000 worth of bnllion is shipped per week, of the average fineness of 986.

MARIPOSA COUNTY.

SUSPENDED.—Meriposa *Gazette*, Dec. 6: Operations upon the Josephine, Bear Valley, were euspended on Saturday, and the Benton mille are no longer rnnning. The entire Mariposa Estete is now lying idle, with the exception that there are ahout a dozen men employed in running a drift in the Josephine or Pine Tree mine. The ceuse of the suspensiou is that the operations for several months past heve failed to pay working expenses.

NAPA COUNTY.

OAKVILLE MINES.—Napa *Reporter*, Dec. 7: There are at work 16 white and 30 Chinemen. The furnece running has the capacity of 10 tone per day of 24 hours, hut another of the capacity of 15 tons is nearly completed. The monthly yield ie from 75 to 102 flaeke.

NEVADA COUNTY.

SCHMITT'S LEDGE.—Nevada *Transcript*, Dec. 5: The new pump works finely, and during the peet week over 20 tone of fine looking rock has been taken out. The ledge continues to look well. They are teking out a great deal of very rich specimen rock, which is to be cruehed separately.

STARTED UP.—Sargent & Jacobs, got their claims in good working order ahout 3 weeks ago. On Tuesday last they commenced washing.

WISCONSIN QUARTZ LEDGE.—Mr. Sweet will re-commence working this valuable property in March next. The ledge is from 2½ to 8 ft. thick, and the rock has never paid less than $60 per ton.

THE SITUATION.—G. V. *Union*, Dec. 7: The Enreka hae yielded about $44,000 for the 4 weeks ending last Saturdey, only 10 stampe running.

The Idaho is doing well. New machinery hae been started within a month. 35 etampe are runniug, and within the month they have made about 12 dayss' run. The yield for the time hae heen in the neighborhood of $40,000.

The Coe will he ready to go to work in a few deys. An additional 100 ft. will he mede to the depth of the shaft. The ledge shows well in a fine formation.

The empire continues to do well. The firet run of two weeke gave ahout $11,000, and the platee indicate that the second rnn will be a hetter one. The ore coming out is very fine.

Independence Co.'e tunnel ie in 325 ft. and ie going to he put through the hill, to tap 3 or 4 fine and large metel bearing ledges which crop ont on the snrface of the hill.

Greenhorn ie heing worked constantly, the greateet depth not inclnding the "enmp" ie 315 ft. Levels are heing run from the ehaft at that depth, both north and south. The north level ie in 18 ft. and the south is in 22 ft. In the north level the ledge is 3¼ ft. thick; in the

south about 2 ft. The ledge shows well in free gold and in sulphurets.

Daisy Hill shaft is down 340 ft., and 80 ft. below the second level. Good quartz and a fine ledge is shown in the bottom. Sinking for the third level.

Green Mountain is being worked constantly with good results. The shaft is down 106 ft., and levels are being run north and south from that depth. A 5-stamp mill is kept constantly at work, and about 4 loads of ore are crushed every 24 hours. The ore being crushed will average $60 per ton.

Gravel Mines.—The town talk is making its regular profits of about $1,200 a month, and has ground enough to last for several years.

The Dartmouth Co. has purchased additional ground, and is putting a railway track from the mill to the new purchase. A tunnel will be run into the ground just bought.

The Baltic, on the Alta range, is preparing to put a tunnel into the hill.

Reuben Thomas, on Grass Valley slide, has renewed his flumes, and he yesterday began to wash bottom gravel.

The Enterprise at Buena Vista Slide will have a mill at work in about 3 weeks, through which drifted gravel will be run.

PLACER COUNTY.

Our Quartz Mines.—Placer *Herald*, Dec. 7: The ore from the main pay chute of the St. Patrick pays from $40 to $50 per ton. The Co. have their main force at work on the Spanish mine. The main shaft sunk on this ledge is on the hill, about 300 yards from the St. Patrick mill, but the ledge is tapped by a tunnel which enters the hill-side about 80 or 100 yards from the mill. The tunnel cuts through the ledge as far ae it is run, which is about 330 foot. The Co. are taking at the rate of 25 tons of ore per day from the ledge, and driving the tunnel further in. The ore thus far, has yielded about $7 per ton, leaving a profit above all expenses of about $2 per ton. The rock is becoming richer as they get further into the hill. On the Cons. Miner the shaft is down 140ft. The ledge prospects encouragingly.

At the Eclipse they have completed excellent hoisting works, preparatory to working the mine on a more extensive scale. They have on dump perhaps 100 tons of milling ore.

Anthony Co.—Placer *Argus*, Dec. 6: The ledge of the Co. is 2,000ft. in length. They have commenced at the lower end of their claim and have run an adit level, along the ledge 300 ft. At that point they have started a tunnel which will run on the ledge, and enable them to drain their ground at a depth of 68 ft. from the surface at a point about midway of the ledge, where they are making preparations for sinking their main shaft and the erection of hoisting works. In running this drain 300ft. they have taken out over 300 tons of rock. It is estimated that the rock will yield a net profit of $12 per ton over all expenses. There has been 2 shafts sunk on the ledge, one of which is 4½ by 9ft. and 44ft. in depth. At the bottom the ledge is 3ft. in width; 70 tons of rock from this shaft has been worked which averaged 22 per ton. About 100ft. distant from the last mentioned shaft another 4 by 9 has been sunk 25ft. deep, at which point the ledge is 30 inches in width; rock taken from this shaft paid $16 per ton.

PLUMAS COUNTY.

Cement Discovery.—Quincy *National*, Nov. 30: The new claims at Onion Valley are paying well. Mr. Stewart, took out for a few hour's last week, $100 in dust and a nugget weighing five ounces.

Prospecting.—The ditch enterprise of Maxwell & Co. on Spanish Creek, is being pushed rapidly, Co. having about 30 hands at work.

Indian Valley.—The Creecent Co. is working a large force. The Green M. Ledge, never looked better than at present. Compton, at Cherekee, is sinking on his ledge, which promises to be better than ever before.

SAN DIEGO COUNTY.

Julian.—Cor. San Diego *World*, Nov. 3: The mines are turning out handsomely. Moore & DeFreea'e mill is running day and night on very fine ore from the Owens mine.

The Helvetia Co. have had 25 tone of ore worked at Moore & DeFreee's mill, and also the same amount at the Reynolds' mill. They have 50 tone more on dump.

The Van Wert contractors have a large lot of very fine ore on dump, and will have a crushing in a few days. The lode looks better than ever.

The Good Hope Co. are taking ont very fine ore, and will soon have a crushing.

The Bush Boye' mine is looking splendidly, and will soon have a big cruehing.

The Stonewall is looking better every day.

The Golden Chariot Co. have concluded a contract to build a wagon road from their mine to the Whitney & McMechan mill, a distance of 4 miles.

The mines in the Cañon are looking better every day. The Kentuck, Madden, Atlantic Cable, Antelope and Pacific are extracting very fine ore.

SIERRA COUNTY.

Wolf Creek Mine.—Downieville *Messenger*, Nov. 30: The Co. have gone to work in earnest to develop their claim.

Mt. Vernon.—Parties owning the Mt. Vernon claime are preparing to work them this winter.

Quit Work.—The China Co. quit work above Jersey bridge, a few days since.

Scales' Diggings.—E. Boyce is pushing to completion a flume across the Saddle betwsen Scales and Council Hill.

At Council Hill the boys are hard at work preparing for winter.

TUOLUMNE COUNTY.

A Success.—Sonora *Independent*, Dec. 7: The silver mine owned by Tulloek, Knowls & Co. is a success. The croppings are 30 ft. wide in the vein. A ton of cap rock sent to S. F. worked over $100 per ton.

Struck It.—They have struck rich rock in the Van Trump.

Goon Yield.—The gravel claim, owned by Per Johnson, has yielded well all Summer. The last wash up, from 20 days' run, was $1,000.

Spring Gulch Mine.—Sonora *Democrat*, Dec. 6: The result obtained from this ore during November was satisfactory. The mine is open to a depth of about 125 ft.; the full width of the vein at that depth has not been ascertained; it is 15 ft. wide and the hanging wall not reached. The ore worked during Nov. averaged $62 per ton; the month's profits over expenses was $4,678. The last 10 tons crushed yielded 173 ozs. worth $17 per oz.

Sommerset.—Is an extension of the Spring Gulch vein, upon which a shaft is being sunk which is down 75 ft. At this depth the vein is 3 ft. wide and shows well with free gold.

We saw at the office of W. F. & Co. this week 273 ozs. of clean, bright retorted gold, the proceeds of the Ferguson for Nov.

YUBA COUNTY.

Marble.—Grass Valley *Union*, Dec. 4: E. A. Harding, has struck a rich vein at Camptonville. The ledge is from 12 to 20 ft. in thickness and contains marble of a grain equal to the best Italian.

Nevada.

EUREKA DISTRICT.

Bullion.—Eureka *Sentinel*, Dec. 4: W. F. & Co. yesterday shipped for Paxton & Co 5 bars, weighing 460 pounds and valued at $2,400.14.

Home Ticket.—An incline is down on the Home Ticket proper about 300 ft. giving a perpendicular depth of 140 ft. Levele have been run in various directions, and in every instance fine deposits of ore have been developed. On the Walter, an incline has been sunk 180 ft. at the bottom of which an immense body of ore was struck connecting with that of the Home Ticket. The Tilton shaft is down 110 ft., disclosing a well-defined ledge from 18 to 20 inches in thickness. This ledge carries high grade ore. The Selby shaft is down 18 ft. in ore. The Ore Cashe shaft is down 58 ft. In the northeast drift the showing in good ore is most gratifying. The Home Ticket tunnel, being run at the base of the mountain, is in 183 ft.; a ledge of soft iron ore was struck, carrying in pockets large masses of excellent silver-bearing ore. One hundred feet further a large and well defined vein of high grade ore was cut. The tunnel has penetrated the ore 8 feet and the end is not yet. A substantial dump and ore chute are soon to be constructed.

ELY DISTRICT.

Bullion.—Ely *Record*, Dec. 1: The shipments last week was $77,573.28.

Washington and Creole.—The contract for sinking the shaft to the 540-ft. level will be completed on Monday. A new station will then be opened, from which point drifting on the ledge both east and west will be commenced. The new machinery, is working well. Blacksmith and carpenter shops are in course of erection. The various drifts and stopes are being vigorously worked and ore is taken ont rapidly. A large quantity is on dump.

Floral Mill.—This mill is rapidly reaching completion. The Sup., is confident he will have it running by the 5th of Jan.

Pioche Phœnix.—The new hoisting works are nearly completed. The main shaft is down 150 ft. In the old works the shaft and incline are down 400 ft. The ledge for some time past has been found in quartzite and has been improving in quality of ore all the while. The ore being taken ont assaye from $400 to $800 per ton. The ledge is 3 ft. wide.

American Flag.—Work is progressing finely. The main shaft is down 400 ft. and a contract will be let to-morrow for sinking 100 ft. further; also for drifting on the 400 ft. level both east and west. There is a fine lot of ore on dump.

Pacific Tunnel.—Supt. Nichols is driving work ahead. In the last week the turntable and blacksmith shop have been completed. The tunnel is in 1,100 ft. and is being pushed on. The winze on the first ledge is down 20 ft., with a fine slate foot wall and the ledge looking well. Stoping and drifting on second ledge, with fine ore in sight.

Chief of the Hill.—Is shipping the usual quantities of ore; the mill will commence running on this ore to-morrow. Winze No. 1 is down 70 ft.; at 100 ft. it will be connected with Nos. 2 and 3, on the 100-ft. level of winze No. 3 drifting west in about 24 ft., the entire length of the drift on ore. During the coming week a working shaft will be commenced from the Burke tunnel level. The stopes are looking well, and the prospects are splendid.

Peavine.—Is improving as developed. The stopes and breastings are looking well, and work is to be pushed ahead rapidly. The mill has been running on the ore since Thursday last, and the pulp assay is $116 per ton. There are about 20 tons on dump, and about 4 to 5 tons per day being taken out.

Marion.—Sinking the shaft. The ground being very hard but little progress is made. It is down 120 ft., and the ledge improves with depth.

Newark.—Work is rapidly progressing. Sinking on the main shaft and drifting from the 475-ft. station is being done under contract.

Bowery.—Prospects very encouraging in bottom of shaft, and Mr. Blair expects to strike the main ledge soon.

Pioche Champion.—The main shaft has attained 170 ft. Sinking by contract has been commenced in fair ground. Within the last week a car track has been added to the whim work.

Montana.—The shaft is down 60 ft. with a 2½ ft. ledge at the bottom. The Co. are working 3 shifts.

Chief of the Hill—East Ex.—The sinking of the shaft below the 90-ft. level has been stopped.

Silver Peak.—The ore in the bottom of the shaft is looking so well that Mr. Cline has concluded to put the full force on this work. There are about 250 tons on dump, and about 6 tons per day are being hoisted. The Condor mill is working this ore up to 78 per cent.

Jolly Traveler.—The last contract for sinking 100 ft. has been finished, and the ledge shows well. At the bottom a peculiar formation has been found, and gives evidence of rich mineral.

Caroline.—A contract has been let for sinking 100 ft. which has attained a depth of 85 ft. At the bottom of the shaft a fine stratum of ore is making its appearance.

Pioche.—Drifting will be commenced in a few days. There are at T. R. Butlers's assay office about 18,000 ozs. of bullion which will be shipped the coming week.

Meadow Valley.—Mr. Maynard has a full force at work in Nos. 3, 5, and 7, and is driving the work fast.

Arkansas.—In the bottom of the shaft the ore is looking well. Drifting and stoping will be commenced on the third level soon.

Amador Tunnel.—The shaft is down 120 ft. from the surface. In a few days drifting will be commenced on the ledge.

Chapman.—Good-milling ore is being hoisted daily, the ore on the dump is being prepared for milling. Work in the lower level continues.

REESE RIVER.

Bullion.—Reese River *Reveille* Nov. 31: W., F. & Co. shipped from this city during Nov., 57 bars, weighing 5,739 lbs. and valued at $76,432.40.

Belmont.—The Monitor Mill has been running a few days to get the machinery well fitted and in good running order. On the first proximo, it will start up for steady work.

The El Dorado Mill begine to loom up in grand proportions. The furnace building was covered this week, and other portions of the heavy frame were raised to their place.

El Dorado South.—On Saturday last the contractors, running the 400-ft. level, struck a spring of water at a point 70 ft. south of the main incline. About 2 inches of water is running steadily from this level.

A few days since a new steam pump was put down in the Belmont Co.'s Canfield mine. The pump works splendidly.

Montezuma.—Plunket & Co. are working the Savage and Monitor ledges. On the former, the tunnel has attained a depth of 300 ft., tapping the ledge first at a depth of 160 ft. The ledge will average 18 inches in thickness; there is a drift 150 ft. in length on the ledge showing ore the entire distance, of a value of from $150 to $300 per ton.

Monitor.—The incline is down 80 ft. showing a ledge varying from 8 to 18 inches in width, of high grade ore.

New Discoveries.—Fred Suhr has located a ledge which is 18 inches wide at a depth of 15 ft. from the surface, carrying ore which varies from $75 to $150.

McNees has located a claim called the "Alabama" which shows a ledge of ore of very high grade.

WASHOE.

Imperial-Empire.—Gold Hill *News*, Dec. 7: Prospecting the lower levels continues.

Cons. Virginia.—Sinking the shaft is making excellent progress, the ground working well. It is down 55 ft. below the 500-ft. level. The north drift on the 1,167-ft. level from the Gould & Curry shaft is driven ahead. Work on the new hoisting works building is being pressed with vigor.

Hale & Norcross.—Sinking the incline is making fine progress. Sinking the north winze from the tenth to eleventh station is making good progress. A blacksmith shop is being established on each level.

Savage.—Daily yield, 145 tons, worth $28 per ton. The incline is down 77 ft. below the 1,600-ft. level, in good working ground. The main drift south on the 1,600-ft. level is driven ahead.

Caledonia.—The south drift on the 400-ft. level of the new works, tapped a large body of water in the early part of the week completely flooding the mine and stopping all work on the lower levels. Prospecting south on the 300-ft. level of the old mine is pushed steadily.

Gould & Curry.—Sinking the main incline goes steadily ahead.

Insurance.—Average samples of ore taken from the underside of the incline assay as high as $40 per ton.

Sierra Nevada.—Daily yield 50 tons of good milling ore, keeping the mill running steadily. Prospecting on the 500-ft. level goes on as usual. The ore breasts in the upper and middle portion of the mine look and yield well.

Globe.—The indications of finding a body of pay ore in the raise from the tunnel level are very encouraging. The main west tunnel is driven steadily ahead.

McMeans.—The main west tunnel is being pushed vigorously ahead, the face in porphyry, with occasional streaks of quartz.

Senator.—All work is suspended for the present on account of difficulties in obtaining the necessary supply of wood. The shaft is 340 ft. in depth.

Union Con.—The north drift on the line of the ledge is in 30 ft., showing a steady improvement in the appearance of the quartz.

Julia.—Sinking the shaft is making good progress. The work of prospecting the 800-ft. level is pushed steadily on.

Belcher.—Daily yield 300 tons. The works shut down yesterday. The drift north from the incline, and south from the ore stopes at the 1000-ft. level, connected with each other on Tuesday. The main incline is down 150 ft. below the 1100-ft. level, and at 167 ft., on the slope, it will be deep enough for the 1200-ft. station. It will be carried 20 or 30 ft. deeper for a sump, before the station is opened. The north drift at the 850-ft. level is in 295 ft. The ore breasts of the 1000 and 1100-ft. levels are looking finely, and a winze is commenced 200-ft. south of the Crown Point line at the 1100-ft. level, to go down and connect with the south drift at the level below.

Chollar Potosi.—Daily yield 130 tons, the assay value of which is $32 per ton.

Crown Point.—The usual amount of ore is yielded from the 1100 and 1200-ft. levels, and the ore breasts and stopes are looking splendidly.

Yellow Jacket.—Yielding little or no ore at present. A heavy influx of water from the Crown Point during the last two days has caused total suspension of the drifting east at the 1500-ft. level from the incline.

Kentuck.—The only work being done is at the old workings about the 600 and 700-ft. levels, gleanings and leavings of richer times.

Buckeye.—Prospecting the different levels goes on with the most flattering results.

Overman.—The work on the new machinery and other surface improvements is fast approaching completion.

Baltimore Con.—Shaft down 349 ft. Drift at the 250-ft. level in 118 ft. toward the ledge.

Silver Hill.—The north and south drifts at the first level are making good progress, with the face of both drifts in low grade ore.

Daney.—All work suspended for the present.

Knickerbocker.—Main west drift in 384 ft. Face in hard porphyry. Indications good.

Occidental.—The main drift north is driven steadily ahead.

Crown Point Ravine.—The shaft is cleaned out and repaired, and all is in good working order to the depth of 64 ft.

Jacob Little.—Usual progress made in upper mine and lower tunnel. Yielding some very good ore.

Colorado.

Bullion. — Colorado *Miner*, Nov. 28: The Stewart S. P. Co. have shipped since the last report 6 silver bars valued at $5,650.25, and 2 lead bars valued at $1,269.45. Total, $6,919.70.

Boulder Co.—Colorado Springs *Out West*, Nov. 28; Arrangements are being perfected at Caribou, so that the mines in that dist. may be worked until very late this season.

Gilpin Co.—The new smelting works, recently started up by the U. S. General M. and S. Co., are considered a complete success.

Park Co.—Some very rich silver mines have been discovered during the past few months near the head waters of the north fork of the South Platte.

Idaho.

Mahogany.—Silver City *Avalanche*, Nov. 31: Supt. Coffin has struck exceedingly rich ore in the Mahogany, 157 ft. south of the shaft.

South Mt. cor. same: The South Smelting furnace started up last week, and are now turning out bullion. They have out about 3 tons, the average being $350 per ton. P. Donnelly has commenced a stope on the Golconda, south of the shaft 80ft. below the surface and taking out a good grade of ore.

The Gen. Grant is being worked. The shaft is some 90 ft. in depth and taking out good ore.

There has been several strikes made here recently. One of them the "Rhuba" is 3 ft. in width and assays from $427 to $750 per ton. Another the "Morgan" is but a small vein and assays some $60 per ton.

The owners of the Rose are erecting a shaft house and intend to continue sinking as soon as it is completed.

Utah.

American Fork.—S. L. *Journal*, Dec. 2: The Miller is running 30 to 40 men, they have recently struck another large deposit.

The Pittsburg is going ahead with a rush, as also the Wild Dutchman—both having made arrangements for pushing work during the winter. The Sierra will also be worked this winter. The Vermont and Bullion are developing good bodies of paying ore, and are shipping to the smelter; and will be worked this winter.

Star Dist.—cor. S. L. *Tribune*, Dec. 6: The Hickory Con. has an incline shaft sunk 70 ft. There is a large body of mineral near the mouth of the shaft 8 or 10 ft. in thickness. On the dump there appears to be about 300 tons of ore, of a high grade, the character of which is chloride and carbonate, carrying a small percentage of lead.

The St. Mary's has a incline shaft sunk 75 ft. This Co. are running a tunnel from the south side of the mountain, which will tap the ledge some 40 or 50 ft. below the surface. The ledge varies from 8 inches to 4 ft., and will average about 2 ft. in thickness. On dump there is, perhaps, 50 to 60 tons of ore, galena and carbonate, worth about $100 per ton in silver, and carries about 50 per cent. lead.

Establish Local Manufactures.

Their Importance to Agriculture.

In past deys the encestors of the present generation of farmers were content to seratch the earth, and to leave to the bounty of unessieted neture and to chence, the hope of an abnndant harvest. As time progressed, ae popnlation increased, wants multiplied, and the struggle for subsistence became more intensified in consequence of increesed numbers, men hed to set their brains to work, and call in the aid of science to help them in the conquest of the stnbborn earth, and snatch from its bosom hidden wealth long locked therein nnheeded—nay, undreamt of. Hence it is thet agriculture has developed in modern times into e science, and the farmer has learned how to increase, meny fold, the production of hie land. But he has yet in many instences to make a

Step in Advance.

In such a country, for instence, as Celifornia with a limited and scattered population, and where the aim of the majority of immigrants possessed of meane, hut devoid of any speciel culture are to enter upon the cultivetion of the soil, it is evident that at no distant period some emberrassmente to the agricultural community muet arise from over production—all are anxious to be farmers, all are anxious to develop the hidden riches of the soil—consequently there results a surplus of production; all are producers—there are few consumers. Foreign merkets have then to be sought, not always pecunierily profitable. Then indeed the cultivator, through excessive competitiou and excessive charges for treneporting to merket his produce, becomee reduced as far as the profits of his lahors are concerned to the state of his prototype of many centuriee ago. Now the fermers of Celifornie, although not bearing such a proportion numerically to the totel popnlation as they do in some other countries, are seemingly epproaching that goal, particularly in the production of wheat. We have

A Surplus of Eleven Million Centals

This year, and will have, probsbly, one of twenty millions next year. We are thus entirely dependent on the needs of foreign countries for the sale of our wheat crop. Supposing for instance that the crops of England heppened to give an extraordinarily good yield, and that there was an excessive influx of cheap wheat from the eouth and eest of Europe, what would become of our farmere? Thousands would be ruined. The

Necessity of a Home Market

Is thus at once apparent, and such a market can only he secured hy the encouragement of local manufactures. Instead of sending his farm produce, one or two hundred miles to port, and then from ten to seventeen thousand miles for a market, the farmer should have a market close to hia own doors. The question is, can he have snch a market, and how? To the first part of the query, we answer, that we think he can; to answer the second is the purport of thie article.

The only way in which a home market can be secured is to foster and encourage home

Local Manufaclures.

A very cursory examination of our lists of imports and exports will show what can thus be done. We import every year, for instance, about one million pairs of hoots and shoes, worth on an average four million dollars. Now it is a well established fact that the manufacture of boote and shoes hss proved to be one of those in which we in California are peculiarly successful, yet we throw away four million dollars yearly, or rather give it to huild up the induetriee of New England, New York and Penneylvania. Now this industry would give employment to not lese than three thousand workmen, who, including the families of the married, would repreeent a popnlation of not less than seven thousand; and including the tradesmen, etc., ministering to their wants, are of not less than twenty thousand. But this ie only a solitary instance; we export leather and hides annually to the valne, probably, of two million of dollars. The leather should here be converted into boots, shoes and saddlery, and the hidee having heen tauned would suhserve the same purposes.

We import annually eight hundred thousand gallons of spirits, which would consume one hundred and sixty thousand centals of wheat, and we import the equivalent of between thirty and forty thousand boxes of raisins every year, while at the same time we are raising the fineet raisin grapee in the world. We could go on edding article after article to the list, such as soap, candles etc., for all of which we have the

Raw Material in Abundance.

And in fect ship it away to receive it again in a manufactured state. We export nearly all our wool, when we possess weter power equel to that of New England, to whose factories it is taken to be eventually retnrned in the shape of clothing, etc., to the annual value of, at least, thirty millions of dollars. In this we annually lose at least, twenty million dollars, an immense wages fund, one thet would pay the wages of twenty-six thousand operatives, whose familiee with the femilies of the tradesmen supported by them would add one hundred and fifty thousand to our popnletion. Now reckoning only those articles, the manufacture of which could be really profitably nnderteken in country districts, we would, did we produce them ourselves, add at leaat two hundred and fifty thousend to our population, hut if we included all the articles of import for which we have facilitiee in San Frencisco, as well as in the interior, we would require

Our Population Doubled,

In order to be able to produce them. From the drift of this article it will plainly be seen thet we advise the erection of woolen mille, tanneries, soep end candle factories, and fruit drying houses, etc., in our towns in the interesta of our fermers, either by men of capital, who ere sufficiently intelligent to be able to recognize the chances lying open to them, or by a union amongst intelligent and enterprising agriculturists themselves. The farmer of to-day should take another step in advance of his oldtime predeceesor, and help in his own interest to manufacture the raw materiel that he himself produces. We think thst there is sufficient inducement for co-operation in this matter on the part of our farmers, and we know that unless they do this, or thet they encouroge some one else to do it for them, thet they may long mourn high freights and low pricee.

Wheat Ships.

Why not Build them on this Coast.

We shell doubtless pay this ycar for the carrying of our whest crop to Liverpool

Twelve Million Dollars.

And allowing one-third of the ships to make two trips a year, will employ at least 200 vessels. But according to higher estimates we will pay neerly *twenty million dollars*, and employ 300 vessels. Even the lowest of theee estimates is suggestive, and has set practical people to thinkiug whether with all our

Facilities lor Ship Building

On thie coast, we cannot in the future mnage to keep amongst oureelves much of this immenee sum, which will go on increasing every year. No part of the earth offers such facilities for ship building as the Statee and Territories of this coast. Immense forests of the finest timber which, even at our present rate of consumption, cannot be exhausted for thousands of years, we have an unlimited supply of material sufficient to build all the navies in the world, and to supply all maritime demands for twenty centuries to come. And there is no expense in transportation, there is sufficincy of material overhanging our northern sounds and hays to build ten thousand veseels close to the water's edge.

What Has Been Done.

We have, comparatively speaking, done very little in past years in availing oursclvee of these immense resources, though the fleet of small craft that does the coasting trade from Puget sound to the Colorado indicstes what can he done. Very little has heen done towards building vessels of a larger class. Messrs. Meiggs & Gawley, of this city, have built the hark "North West," of 600 tons, the hark "Tidal Wave," of 700 tons, and the ship "Wild Wave" of 1,200 tons. These have cost reepectively, "North West" $40,000, "Tidal Wave" $45,000, and "Wild Wave" $70,000. Besides these there has heen huilt the hark "Foreet Queen," about the eame size as the "North West." All these have heen built at Puget Sonnd, where wooden ehipe of any class can he built mnch cheaper than in San Francisco at present, for we have the additional cost of carrying the lumher hither, superadded. The Puget Sound pine is said by competent anthorities to he as good as the hest Eestern oek for the construction of ships, while it is infinitely cheaper. For the rndder and stem posts the California laurel ie the superior of oak while it is considerahly cheaper. And the Port Orford pine makee as durahle and as handsome a deck as can he found in the commercial woods of Europe or America. And maste straight ae an arrow and three or four hundred feet long can he obtained at the Sound about as cheap as saw logs.

The Cost.

Composite ship—one of pine, sheathed with iron, would he $110,000, and the cost of building and fitting out a wooden ship so ae to be ready to load wheat at the city front, is $60 per ton of measurement. For a thousand ton wooden ehip, the cost would therefore be $60,000. Such a ship would carry 28,000 centale of wheat at one trip, which would bring in a revenne of $38,000. So that, counting in the freight received on the return voyage, the ship would at present prices more than pay for her cost within one year. But even supposing freighta were only half what they now are, such a vessel would nearly or quite pay for herself in a few years. The reason

Why Ships are not Built

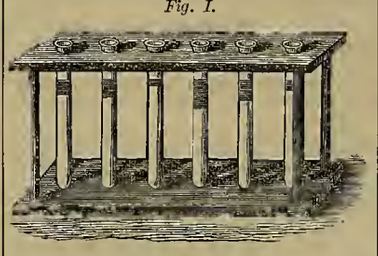
On this coast, when such a magnificent return can be obteined, is due solely to the went of enterprise and high prices of interest. Those who understend the business are afraid to borrow money when they have to pay from 1½ to 2 per cent. per month, and those who heve the money do not possess the enterprise.

The Lactometer.

The engravings here presented are gotten up by us for the purpose of illustrating an article which we copy from the *American Agriculturist*. The instrument described is known as the Lectometer, and is used for determining the quality and value of milk for the production of butter, and should be used by every farmer who owns more than one cow.

Where there are but two it becomes a metter of interest and curiosity to know which one is the better, and where there are a dozen, the

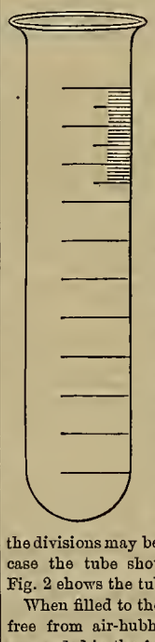
Fig. I.



probability is that there will be found one amonget the lot which is not worth keeping, and she can not easily be detected without experimenting on her milk with the lectometer.

We very rarely think of the fact that the average yield of butter in the United Statee is only a quarter of a pound per cow per day, or of milk only four quarts. The discovery of these poor cows, by which the average is so much reduced, and their separation from our herde, depend on the use of some such instrnment as is here proposed. It is simply and easily made. (Fig. 1.) A frame, consisting of an upper and a lower plstform, with supporting columns at the cornere is made; holes to receive the glass tubes are bored through the upper platform, and the tuhes are common glass test-tubes, which may be procured from or hy any druggist. The tnbee should be divided by marke made with a common file into ten spaces of equal size. The spaces or degrees may be one inch in length, in which case the tubee should be eleven inches long; or the divisions may be half an inch apart, in which case the tube should be six inches in length. Fig. 2 ehows the tube graduated into speces.

Fig. II.



When filled to the uttermost mark with milk, free from air-hubhles or foam, the tubes are suspended in the frame, and are to be kept undisturhed for a determined length of time, and the amonnt of cream which has risen ie then noted, when it may remain longer to note any further riee of cream, or the separation of the whey from the curd, if it is desired to teet the amount of whey or water or solid matter or curd in the milk. Those lactometers which test the quality of milk by its epecific gravity are often incorrect and fallacious, as the richest milk is the lightest specific gravity, and is not to be distinguished by such a test from watered milks.

The exact percentage of cream may be ascertained by dividing the upper epaces into tenths. Each tenth would represent one-hundredth part or one per cent. of the whole milk. Thus, if the cream occupies five of the small spaces, there is five per cent.; if one large space, there is ten per cent.; if one large space and two small ones, there would bo twelve per cent.; two large snaces would give twenty per cent. of cream.

As one quart of pure creem will make a pound of butter, the value of each cow ae a hutter-producer is resdily escertained, for if she should yield ten qnarte of milk, of which ten per cent. or one-tenth is creem, ehe may be expected to produce one pound of bntter per day, and so on.

The Mineralogical Museum.

Mr. Henry G. Henks, of the Pacific Coast Mineral Agency, the well known assayer and mineralogist, has recently returned from a trip of several months duration in Europe. During his sojourn on the Continent Mr. Hanks procured several valuable geological and mineral epecimene which he hes placed in his mnseum, No. 649 Clay Street. By the way, we do not believe it is nearly as generally known as it should be that there *is* a pnblic mineralogical museum in this city, most complete and cerefully selected and arranged, and which is absolutely free to all. Mr. Hanks is one of the most thorough mineralogiets on the Pecific coest. We are snre that there is no other who would more reedily devote his valusble time and attention in minutely deecribing the different specimens which fill his csses than this gentleman.

The museum consiets of twelve lerge and hendsomely finished glass ceses and eight elegant upright cases, containing a selection of specimens of minerals clessified ae follows: Silver group, Iron, Copper, Leed, Quartz, Sulphur, Mica, Amphihole. The quartz group of couree embraces the gold bearing ores.

Besides the ahove, this valuable collection contains epecimens recently obtained from the South Africen diamond fields. Topez from Brezil and from Durango, Wyoming, and N. S. Wales. Opale from Wyoming. Stones from Pacific Ruby and Diamond Co. Rubies from Brezil. Turqnoie from Pereia, and Sepphires from Idaho, etc., etc.

The pëtrifactions and fossile alone are well worth a visit, and in fact this museum is one of the few places on this coast where one can enjoy a few hours with the mineral producte of this and other countries, with ease and comfort aud without cost.

Composition of Precious Stones.

We condense from the "Explorers', Miners' and Metallurgiste' Companion," (J. S. Phillips M. E.,) as follows:

The Diamond.—Pure carbon, either transparent and colorless, or variously colored, yellow, blue, green, rose, or brown, but rerely black. It is known by its scratching all other gems.

Emerald (Beryl).—Two atoms tersilicate of elumina, 1 atom tersilicate of glucina — the former colored by oxide of chromium, the latter by oxide of iron. Crystallizes in hexagonal prisme; color green; *beryl* being sometimes from blue to yellow.

Opal (Precious or Noble.)—Compoeed of soluhle silica, with a varying quantity of water, sometimee 10 to 12 per cent.; milk colored; but exhibits in the light of day a changing interior play of pearl-like colors — green, hlue, yellow and red, which become yellow by transmitted light. Not as hard as quartz.

Sapphire (Corundum). — This gem, when perfectly white, seems to he pure alumina (aluminum 53.29, oxygen 46.71). It, however, consists of two precious varieties, the sapphire proper, and the oriental ruby. The former has a epecific gravity of from 3.9 to 3.97; the latter of somewhat lees. There is also a common corundum, and ordinary emery.

North Bloomfield Company.—This Compsny is doing a tremendous amount of work in their varioua claime, ditches, reservoirs, etc., on the ridge. Every character of mining is heing done hy them, and they give employment to every man that wants to work, regardlees of hie color, nationality and qualificationa. They have every kind of work to he done, and when men are incapable for one class of work they try them on another, and so on until they get them in the right place. They would give employment to a great many more men if they could get thcm. The company is paying out from $40,000 to $60,000 per month for labor, machinery and tools. Their operations are of the most stupendous character, and they have one of the best and most capahle Superintendents in the State to manege the works.—*Nevada Transcript.*

Silicates by Sublimation.—Recent examinations of a remarkahle hlock of lava ejected by Mount Veenvious during the eruption of April, 1872, made hy Prof. Rath, have proven, according to that scientiet, the formation of silicates by sublimation.

Useful Information.

Power of Comprehension.

It is said of Thoreau, that he could take up any given number of lead pencils without counting. A celebrated trapper once assured us that he could tell how many balls he had in his bullet pouch by placing his hand on it, and without stopping to count them, and added: "I can tell the number of bullets instantly, without stopping as you pronounce a word without spelling it." Southey was accustomed to take in the substance of a book in turning the leaves over continuously, glancing down the pages. Houdin, the magician, trained himself to quickness of perception, when a boy, by running past a show window at full speed, and then trying to tell what was in it. We once saw a man on a canal boat who was amusing himself by going from passenger to passenger and telling almost every one where he had seen him before, on such a train, in such a hotel, in such a street, giving date and place to people with whom he had never exchanged a word. This training of the faculties in particular directions is carried to a marvelous extreme by backwoodsmen, trappers, and men who guess the weight of animals. Perhaps the most remarkable instance are the markers who leap from log to log at the mouth of a boom, standing on a log and translating instantly an old mark into a new one, remembering what equivalent to give for each of a hundred marks, and chopping it upon the log in the time that it floats its length. It is said that Thoreau knew the relative order of flowering of all the plants in the Concord woods, and knew the note of every bird, and a thousand out-of-the-way things besides.—*Hearth and Home.*

The Useful and Beautiful.—There are really two ways to do a thing well. The one studies utility and economy without any regard to how it will look. The other includes both, and in addition, the door is often influenced by taste, giving the preference ever to that way of doing a thing which shall most directly promote the beautiful in union with the useful. Taste displays itself in the selection of the site for building, the plan and style of architecture, planting trees, making fences, laying out grounds, the color of buildings, etc. Some in these display taste; others seem to show an utter want of, or disregard of it, everything seeming to be done with reference only to the short-sighted utility. Attention to matters of the kind mentioned, would soon produce a favorable change in all our rural regions. Much has indeed been already done, toward the bringing about of this desirable change, but much more can be done. What we would say then is —let every owner study to make his home beautiful and attractive.

Curious and Useful Crow.—J. Snyder of Virginia, owns a crow which serves as a substitute for dogs, cats and all other domestic sentinels. He destroys every frog about the well; allows a mouse no chance for his life; drives away hawks from the poultry; and bids fair to act as the best squirrel dog in the country. He readily spies the squirrel, either upon the fence or on the trees, and with a natural antipathy to the squirrel tribe, his shrill, keen note is readily detected by his owner, accompanied by rapid darts up and down, and the owner is thus led to the game. The most remarkable feature about the crow is, that he invariably keeps five or six day's rations ahead of time, well concealed.

To Get Rid of Fleas.—Mr. Ely said at a late meeting of the New York Farmers' Club that there are two or three substances that are obnoxious to the flea—he does not like the smell of them, or they remind him of something he does not like to think about—these are carbolic acid and sulphur. If you want a barn thoroughly purged of weavil, or lice, or fless, the best way is to fumigate it with sulphur. But if you whitewash all around the stables and posts of the yard with a whitewash made by adding carbolic acid to the lime, it will drive most of these pests away. Washing an animal thus infested with carbolic soap-suds will give relief.

Charcoal as a Purifyer.—The *Country Gentleman* says: All kinds of utensils can be purified from disagreeable odors by rinsing them out with charcoal dust wet into a soft paste. Putrid water is immediately deprived of its bad smell by its use. When meat flesh, etc., are liable to become spoiled from long keeping, charcoal dust will keep them sweet; and if there is a single taint to meat, it can be taken out by putting three or four pieces of it as large as an egg into the water in which it is boiled. This will effectually purify what seems too far gone to use.

A Useful Hint.—A tin tube made like a syphon, driven into the vent of a barrel of wine or cider, and the other end inserted into a vial of water, will prevent the air from entering the barrel, while the gas escapes through the water. Make the barrel otherwise tight. When the cider or wine in the barrel is done working, the water in the bottle will cease bubbling. It requires no filling up, as there is no loss. The tube can be made by any tin-plate worker, and when once made can always be kept for future use.

What is "Black Heart" Redwood?

In the first place no such kind of wood exists. It is a difference based on the slightest of distinctions. Ordinary redwood and "black heart" will be found to come from the same tree. It is a small part of the lower extremity of the tree, which, on account of its near approach to the roots, is more than usually tough and compact, to which is given this name. In some trees it is not even to be found, owing to the local peculiar formation, and in those where it is the amount is very small. It is a task of great labor to get even enough to lay even a simple block, as was the case with that put down in front of the City Hall, and to speak of repairing the large amount of damage which now needs to be attended to in many streets of our city with this scarcely obtainable species of wood, is something of which it is ridiculous to consider. But even with "black heart" redwood, E. T. Crane, writing from San Lorenzo, has said that from his personal experience he had found planks of the best "black heart," after eighteen months, "were so decayed that you could stick a spade half way through them," and none were found but what had commenced to decay. As to the amount of water, which is a primary means of decay, that it will evaporate normally, and afterwards take up, twenty-nine and a half per cent. has been found to be an ordinary percentage.

From this it will be seen that every way, both on account of its non-usefulness, adaptability, and by reason of the impossibility of obtaining a quantity sufficient for the contemplated repairs, that the use of the so-called "black heart" redwood is out of the question.—*Alta.*

Best Time to Paint Houses.—The *Technologist*, a good authority, states that paint applied to the exterior of buildings in autumn or winter will endure twice as long as when applied in early summer or in hot weather. In the former it dries slowly and becomes hard, like a glazed surface, not easily affected afterward by the weather, or worn off by the beating of storms. But in very hot weather the oil in the paint soaks into the wood at once, as into a sponge, leaving the lead nearly dry and nearly ready to crumble off. This last difficulty, however, might in a measure be guarded against, though at an increased expense, by first going over the surface with raw oil. Furthermore, by painting in cold weather you escape the annoyance of small flies, which invariably collect during the warm season on fresh paint.

How to Oil a Harness.—A correspondent of the N. Y. *Tribune* says:—Linseed oil is sometimes applied, or sweet oil which is not made from olives, or other adulterated oils, which dry on the leather and cover it with gum. To properly oil a harness it should be taken apart and washed with a sponge and warm soapsuds; then wiped, and while damp greased with clean tallow mixed with lamphlack; this should be rubbed in while warm until the leather is filled; it should then be rubbed with cloths until it does not stain the hands. After one complete dressing an occasional application of the tallow and lampblack will keep the harness in good order, and there will be no gum for dirt to stick to.

Selling Stumps.—Walnut stumps are getting valuable as articles of merchandise at the East. Some one has discovered that the curly grains of the roots can be used for veneering purposes with great success, and the result is that they are in demand, and are worth one hundred and fifty dollars per stump. Some of the backwoodsmen of the forests of Iowa, Minnesota and Wisconsin are getting out the stumps rapidly, and are creating a new and valuable trade. The veneering made of these roots is said to be most beautiful, and can be used in the finest work, and is particularly adapted to use in the manufacture of musical instruments.

The Ohio *Farmer* says more injury is done to carriages by greasing too plentifully than the reverse. Tallow is recommended as a better lubricator than lard for wood axletrees, and caster-oil for iron; lard is apt to penetrate to the hub, and work its way around the tenons of the spokes and spoil the wheel. Just enough grease should be applied to the spindles of a wagon to give it a light coating. To oil an iron axle, first wipe clean with a cloth wet with spirits of turpentine, and then apply a few drops of caster-oil near the shoulder and end. One teaspoonful is enough for the four.

To Preserve Polished Metallic Articles from Tarnishing in the Air.—M. Pascher says: Melt in an open glass vessel heated in warm water 15 parts of paraffine to which has been added about 45 parts of petroleum; after becoming almost cool, it may be applied to the object to be protected.

Cotton and Asbestos Fibre.—A company has been organized in Philadelphia to operate a series of patents granted recently to Mr. Rosenthal, of England, for manufacturing textile fabrics upon his plan, of mixing with the wool or cotton fibre a variable quantity of asbestos.

A new preventive for boiler scale is announced in England, in the shape of the leaves of the barberry, a wild, trailing plant, common in this country, and also found in England and Scotland. The leaves are said to contain gallic and tannia acid.

Good Health.

Bee Sting—How to Treat It.

The sting of a bee is naturally more violent than that of a wasp, and with some persons is attended with fatal effects. Two deaths from such a cause have recently occurred. The sting of a bee is barbed at the end like a fish-hook, and consequently is always left in the wound; that of a wasp is pointed, so that it can sting more than once, but a bee cannot. When a person is stung by a bee let the sting be instantly pulled out, for the longer it remains in the flesh, the deeper it will pierce and the more poisonous it will become. The sting is hollow, and the poison flows through it, which is the cause of the pain and inflammation. The extracting of the sting requires a steady hand, for if it break in the wound the pain will continue for a long time. When the sting is extracted, suck the puncture, and thus prevent inflammation.

Spirits of hartshorn, if applied to the affected parts, will more fully complete the cure. The poison is acid, and the alkali will neutralize it. If the hartshorn is not at hand saleratus can be wet and laid upon the place; and soft soap will often ease the acute pain. On some people the sting of bees and wasps have little effect, but it greatly depends upon the state of the blood whether it will prove injurious, and these simple remedies if applied at once, will soon effect a cure.—*Ex.*

Caution to Athletes.—In a paper in the *Lancet*, Dr. Cornelius Black, of Harley street, Cavendish square, London, thus refers to the effect of violent exercises on the heart: They hurry the heart's action to an inordinate degree; they cause it to throw the blood with force into the extreme vessels, and as there is almost always one organ of the body weaker than the others, the vessels of this organ become distended, and remaining distended, the organ itself becomes diseased. Running, rowing, lifting, jumping, wrestling, severe horse-exercise, cricket, foot-ball, are fruitful causes of heart disease. Those which require the breath to be suspended during their accomplishment are more fruitful causes in this respect than those which require no such suspension of the breathing. Rowing, lifting heavy weights, wrestling, and jumping do this; and of these rowing is the most powerful for evil. At every effort made with the hands and feet, the muscles are strained to their utmost; the chest is violently fixed; no air is admitted into the lungs; blood is thrown by the goaded heart with great force into the pulmonary vessels; they become distended; they at length cannot find space for more blood; the onward current is now driven back upon the right heart; its cavities and the blood vessels of its walls become in like manner distended; the foundation of disease is laid. Hypertrophy, hæmoptysis, inflammatory affections of the heart and lungs, are the consequences in the young; vavular incompetency, rupture of the valves or of the muscular fibres of the heart, pulmonary apoplexy, and celebral hemorrahage, are too frequently the immediate consequence in those of more mature years.

Ague Spores.—In a communication to the French Academy, M. Bolestra, states that, in examining marsh water he always finds, in proportion to its degrees of putrefaction, a granular microphyte, somewhat resembling in form the Peruvian cactus. It is always accompanied by a considerable quantity of small spores, greenish-yellow, and transparent. This plant grows on the surface of the water; when young, it is rainbow-like in tints, and looks like spots of oil. At the low temperature of cellars containing no vegetation and in winter, it develops slowly, but in contact with air and exposed to solar rays, it grows fast, disengaging small air-bubbles. M. Bolestra thinks that those spores constitute ague poison, and that they can be found in marsh air. He himself caught ague twice during his researches—once after being exposed to air from water in fermentation covered with fresh algæ in full vegetation, mixed with an extraordinary quantity of spores.

Absorbing Power of the Human Skin.—Dr. Thomson of Edinburgh relates some experiments which he tried on his own person to ascertain the truth of the statements made as to the curative power of mineral water baths, depending on the absorption by the skin of certain salts and other substances which they hold in solution; and further, to ascertain whether certain substances applied in the form of ointments, etc., pass through the skin and reach the blood before they produce any beneficial effect. His conclusions are that not only has absorption by the skin been greatly exaggerated, but in the case of substances in aqueous solution it seems to be the exception, not the rule, for absorption to take place; and that, in the case of ointments, etc., some of the substances so applied seem to be absorbed and others not.

Death from a Piece of Needle in the Heart.—According to the Cincinnati *Lancet and Observer*, at the post-mortem examination of Miss Hoag, of Evanston, Ill., it was found that death was caused by the presence of a piece of needle in the heart. The needle was driven in by a sudden fall when she was about seven years old. The portion of needle extracted was about an inch and one-eighth long.

Under-Clothing for Cold Weather.—For children of three years and over there is nothing better, perhaps, than an under-garment clothing the body from the neck and wrists to the heels, much like the night-drawers children wear. They may be made with a plain, easy, high-necked waist, with long, straight sleeves, and with open drawers sewed to the waist. The drawers should be rather full at the top, but small enough at the lower part of the leg to go inside the stocking, reaching to the heel, or leaving no gap above the shoe. "Doctors disagree" about the material of this under-garment, some recommending woolen and some cotton. Taking into account the difficulty of washing woolen without shrinking it, and the disagreeable sensation many skins experience in wearing it, probably the best way in most cases is to have this under-garment made either of cotton flannel or of thin cotton-cloth, with a similar garment of warm woolen material over it. Buttons at the waist support the other under-clothing.

French Theory of Fatal Remedies.—According to M. Alphonse de Candolle, when a fatal malady has seriously affected the younger portion of a population, the succeeding generation, descended from persons who escaped the disease or were but little affected by it will be found less liable to attack, as an ordinary effect of the law of descent, this continuing to be the case from generation to generation. This, therefore, constitutes one cause of the weakening of epidemics, and may serve to explain the reason why a disease is most injurious when it first attacks any people, and why it subsequently becomes rarer and less dangerous, as has frequently been observed. After the lapse of several generations, however, a population moderately affected by disease approaches the condition of one which has never had it, and increased intensity may then ensue.

Relative Value of Disinfectants.—In the Central Chemical Department of Public Health at Dresden, numerous researches have lately been made with various disinfecting materials for the purpose of disinfecting liquid manures; the chief results are appended below. The value of chloride of lime and sulphuric acid, which form the most effectual disinfecting material, is here expressed by 100; while the remaining numbers show the value of the other materials as compared with this standard:

Chloride of lime with sulphuric acid	100.0
Chloride of lime with sulphate of iron	99.0
Luder and Liedloff's powder	92.0
Carbolic acid—disinfecting powder	85.6
Slaked lime	84.6
Alum	80.4
Sulphate of iron	76.7
Chloralum	74.0
Sulphate of magnesia	57.1
Permanganate of potash with sulphuric acid	51.3

The Medical Botany of California.—Dr. W. P. Gibbons, of Alameda, has been devoting considerable time and labor to the investigation of the medical properties of the plants peculiar to this Coast, and solicits the aid of his professional brethren in different quarters. In a paper, lately read before the State Medical Association, he describes a number of cases showing marked benefit from the *Grindelia* in Asthama, and thinks it will prove a valuable remedy, if employed with proper discrimination. There are two species which appear equally active, the *robusta*, growing in low places, and the *hirsutula* on dry fields and hills. The infusion he regards as the best preparation.

Poison Oak.—Experiments with animals go to prove that poison oak *(rhus toxicodendron)* may be eaten with impunity. Indeed we have frequently heard it asserted by persons in California that they have seen it eaten by men, with a view of its acting as an antitidote to its poison externally, or from mere braggadocio. All Californians are aware of the violence with which its juice acts when applied to the skin of most persons, many being severely poisoned by its slightest touch. It is also claimed that some people are so sensitive to its action as to be seriously poisoned by its exhalations, without any contact whatever with either its juice or foliage.

Hay Fever—so-called, has not yet generally been recognized by physicians as a separate disease, but a recent writer on the subject seems to have established its individual identity. "Autumnal catarrh" is the scientific term given to the disease. No cure has been found for it; but it has been observed that there are many places where the disease is not contracted, and where it disappears from those suffering with it in a few days. Most of the White Mountain and Adirondack regions are free from it, nor is it known in Germany or France.

The growth of the hair, the durability of its color, its flexibility, elasticity and gloss—depend solely upon its sanitary condition; and there is nothing under the sun that so effectually promotes the health of the fibres and of the integuments from which they spring, as correct hygienic habits.—*Science of Health.*

A man will die for the want of air in five minutes, for want of sleep in ten days, for want of water in a week, for want of food at varying intervals, depending on constitution, habits of life and the circumstances of the occasion.

Colic.—One or two heaped teaspoonfuls of common salt in cold water will sometimes relieve; repeat, if necessary. A teaspoonful of turpentine and twenty drops of peppermint is also good.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG. JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

San Francisco:

Saturday Morning, Dec 14, 1872.

Legal Tender Rates.—S. F., Thurs., Dec. 12—Buying, 88⅞; Selling, 89¼.

Table of Contents.

GENERAL EDITORIALS.—Kill the New Industry; The Stanton Rnhy, 369. Establish Local Manufactures; Wheat Ships; Mineralogical Mnseum, 374. National Schools of Science; Notices of Recent Patents, 376. ILLUSTRATIONS—Corkscrew Growth; Grains of Science, 369. The Lactometer, 374. Quartz Mill Crushers, 376.

SCIENTIFIC PROGRESS.—A New Theory for Volcanoes and Earthquakes; Telegraphing hy Sound through Water; Density of the Supposed Resisting Medium in Space; Spontaneons Decomposition of an Alloy of Lead; Luminons Meteors; Underground Temperatures, 371.

MECHANICAL PROGRESS.—The Life and Wear of Rails; Monster Derrick; Patents in Japan; Iron Buildings; Wrought Iron Tubes; A New Kind of Flint Glass; Boiler Scale; Mechanical Invention; American Engineers, 371.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorsdo, Idaho, Montana, and Utah, 372. Market Reports, 33 0.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Revlew of Stock Market for the Week, 372.

USEFUL INFORMATION.—Power of Comprehension; The Useful and Beautiful; Curious and Useful Crow; To Get Rid of Fleas; Charcoal as a Prnifyer; A Useful Hint; What is "Black Heart" Redwood; Best Time to Paint Houses; How to Oil a Harness; Selling Stumps, 375.

GOOD HEALTH.—Bee Sting—How to Treat It: Cantion to Athletes; Ague Spores; Absorbing Power of the Human Skin; Death from a Piece of Needle in the Heart; Under-Clothing for Cold Weather; French Theory of Fatal Remedies; Relative Value of Disinfectants; The Medical Botany of California; Poison Oak, 375.

MISCELLANEOUS.—Coal Fields and Golden Sands of Oregon; The Mount Lincoln Silver Mines; Mining in British Columbia, 370. Composition of Precious Stones; North Bloomfield Company, 374. Camp Floyd District, Utah; Smelting Works in Utah; The Mining Interest of Calaveras; Resumption of Mining at Brown's Valley; The Oldest Steamer in the World, 378. The Diamond Swindle, 380.

STREET RAILROADS.—The exigencies of the horse diseaes in the Eastern States have turned the attention of the public to the necessity of some other motive power than horses on street railroads. In New York they are now experimenting with steam for that purpoee. Cars were reported to be running euccessfully in New Orleans some time since, which were propelled by steam. The engine in use there is the invention of Dr. Lamme, and no fire ie nsed in the locomotive, bnt hot water is placed in a peculiarly constructed boiler, at one end of the road, and the power thne etored suffices to run the car a distance of five miles, including necessary stoppages. If this fireless locomotive ie running as well as has been repreeented to us, we do not eee why it can not be nsed in other large cities aleo.

THE CALIFORNIA INVENTORS' AND MANUFACTURERS' ASSOCIATION, noticed in onr list of new incorporatione, announcee its object to be the assistance of inventore in bringing their inventions to enccess. If managed by competent men, in good faith, who will advance the necessary means, we wish it snccess. We expect to be ahle to post our readers more fully concerning the aesociation hereafter.

MICROSCOPICAL SOCIETY.—The San Francisco Microscopical Society is in a flourishing condition and likely to remain eo. They have jnet received a eplendid large microscope, mannfactnred hy R. & J. Beck, the famous London makers, which is eaid to he one of the finest on the Coast.

ANOTHER NARROW GAUGE ROAD.—Arrangements are being made to build a narrow gange railroad from Salt Lake City to Echo City, on the line of the Union Pacific, a distance of 45 miles. Utah ie doing much to develop her resonrces in building theee roads.

National Schools of Science.—The State University.

Humboldt never msde a truer or more important utterance than that in which he declared thst practical ecience formed the chief eource of a nation'e wealth, and that it often, indeed, stood ae a full eubstitnte for thoee natnral riches which nature, in many csees, has dietributed with so partisl a hsnd. This utterance is a truth which should be converted into a living fsith in the minds of all who have a heart interest in the material development of national prosperity. It is to he regretted thst practical science has not yet reached its just position in pnblic esteem, notwithstanding the rapid progress it ie making in many European conntries, and the increased appreciation in which it is being held by progreseive, thinking minds everywhere.

Time wss when s nation's prosperity was founded almoet exclusively upon local advantagee or an accidentsl combination of circnmstancee, and when the dead snd dying languages or the mere *theories* of science, were about all thst was thought necesaary to teach in our schools and higher seminaries of learniug. Governmente then busied themselvee about the affairs of State, never dreaming thst the parental relstione which they snstained towsrds the people shonld include any csre about the education of the young, with a view to a proper preperation of such for their own msintainance and the prosperity of the State, when they came to take upon themselves the csres snd responsibilities of manhood.

But science, in its progress and practical sdaption to industrisl pursnits, has of late produced a wonderful trsnsformation in human conceptions, and is now teaching the nstions the important leeeon that they must acquire snd maintsin their reepective levels by the force of their intellectual developments, instead of resting exclneively upon the nstural developments of eoil and climate, or on their more favorable geographical positon. It long since csme to the knowledge of the people, and more latterly has been impreesed upon the minds of rulers, that the nation which is most liberal and earnest in the intellectual improvement of ite working and producing classes—particularly its artisans and mechanice—is destined to override all local advantages, sud leave far in the rear, in material progress, all such people as attach less importance to the intellectual development of their populations. Even a enper-ahundance of capital, and the posseecion of snperior agricultural or commercial advantagee, combined with inexhaustible mines of precions metals, are nnable to compete in the modern march of national progress, with a people of intellectual training, though blessed hut eparsely with natural advantages.

There never was a period when a union of skill and science was so mnch needed by the nations of the earth as the present, and there never was a people which controlled eo many favorable conditione to be placed in combination with practical ecience as do the occupants of this central Pacific Slope. And it is one of the most encouraging evidencee of onr future progress that both rulere and people are wske ing up to the importance of these facte. As an evidence of this we find that both the State and General Government has been liberal in the endowment of onr State University, while ite managers are becoming more and more alive to the magnitude and importance of the trust committed to their charge.

The late instalment of Prof. Gilman as President—a man of progrees and and one thoronghly alive to the greater importance of practical education, as contrasted with the mere classical acquirements but lately considered as the chief end of education, is hopeful of the most beneficial results. The unanimous election of ex-Governor Haight, to fill the vacancy occasioned by the death of the lamented Edward Tompkins, is also a matter of congratulation Gov. Haight is well known as a progressive man, as is fully evinced by his admirable address at the Commencement two years ago, in which the breadth and soundnees of his views upon liberal education was fully illustrated.

A more perfect accord is also ohtaining between the educational head or Faculty of the Univereity, and its executive department—the Board of Regents. The latter have made a good move in inviting the President to sit with them and share in their deliherations, and we have no donbt that Prof. Gilman's experience will enable him from time to time to make and impress upon the attention of the Board many valnable snggestione, which otherwise might not he properly hrought to their attention. Such mntual deliheration can scacely fail of most happy results.

It ie aleo most gratifying to observe the improved interest which is being felt, throughout the Union generally, on behalf of National Schoole of Science. It appesre thst every individual State hss taken meaeuree to eecure the munificient lsnd grant offered by Congreee in 1862, and that thirty-four of the number have alresdy fully secured the ssme. In moet of the States, ss in California, large additione have also heen made to the grsnt by Stste or individusl liberality, or both.

The Agricultural Collegs Act, eo called, has thue hecome one of the moet pregnant and ueeful measuree ever initiated by Congreee for advancing the material intereste of the Nstion.

It should be borne in mind, that though the bill referred to is popularly and legally cslled an Agricultursl College Bill, it is in fsct a grant for the encouragement and eetablishment of Colleges for all brsnches of modern ecientific instruction, and has been eo construed in ite application to the University of California, and to Universities in several other States of the Union.

We thne have a syetem of National Schools of Science growing up in every Stste to which all men have accees—the poor as well as the rich—the yonng, middle aged and adults, and generslly without regard to sex—each one having reference to his or her cslling in life, whatever he or ehe may have chosen. In most of the States this "University" is also joined and grafted upon the common school system, and thus made the final snd crowning point of that great modern agent for elevating and improving the condition of the massee.

So popular have these schools hecome, snd eo wouderful hse slready been their effect in expanding, deepening and practicslizing onr syetem of educstion from the common echool up to the old-time "College-course," that another bill was introduced in the Senate at ite laet session, by Senator Morrill, of Vermont, for a still farther endowment to the Universities which have been called into existence by the "Agricultural College Bill," and within the past week the telegraph has informed ue that even during the preseure of business in the present ehort seesion, Mr. Morrill's bill hae been again called for immediate action thereupon.

There is every reason to helieve thet our people have finally entered upon a march of national progrees, wherein other natious have heen endeavoring to outstrip us, by offering to their masses euperior facilitiee for the acquisition of practical ecience. It was with such an end in view that the great philosopher, from whom we quoted et the commencement of this article, many yeare ago wrote for the encouragement of his countrymen in carrying out the enlightened plsns of education which they were then just setting on foot:—"An equal appreciation of all psrts of knowledge, is sn especisl requirement of the present epoch, in which the material wealth and incressing prosperity of nations, ie in a grest messure based on a more enlightened employment of nstnral products and forcee." Let us profit by the wisdom and experience of that people whose eminently practical education, alone, rendered the late terrihle events at Sedan and hefore Paris a possihility within the reach of human agenciee.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Dec. 10th, 1872.

FOR WEEK ENDING NOVEMBER 26TH, 1872.

MEDICAL COMPOUND.—Levi B. Millard, San José, Cal.

SKATE FASTENING.—John Hunter and Joel T. Chenoweth, Denver, Col. Territory.

EGG CARRIER.—George M. Hueton, S. F., Cal.

SHANK FOR TOOLS.—Albert H. Suplee, S. F., Cal.

SULKEY.—John A. Bilz, Pleasanton, Cal.

——The patents are not ready for delivery hy the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than hy any other agency.

Notices of Recent Patents.

Among tho patents recently obtained through Dewey & Co's. MINING AND SCIENTIFIC PRESS, American and Foreign Patent Agency, the following are worthy of mention.

DEVICE FOR CHARGING DRILL HOLES WITH POWDER.—Francie H. Lavalle, Auburn, Cal. This invention relates to a novel instrument for charging the holes which are made by a drill for blasting purposes, with Gisnt or other powder, for the purpose of compacting it, preparatory to exploding the blast. A metal tuhe, or charger is employed, which contains the required amount of powder to charge the hole. A piston movee in this cylinder, and has a rod extending through the upper end of the cylinder, and through a tube which is screwed upon its upper end so as to extend to the required distance from the charger to permit it to he inserted in the drill hole while the operator retains hie hold upon the tuhe. To uee this charger the desired amount of powder ie placed in the cylinder and pscked by compression if desired, the pieton being withdrawn by means of the handle ae far ae poesihle. The cylinder is then inserted in the drill hole and pnehed down to the bottom; the piston ie then forced down eo as to force the powder out of the cylinder. If desired, the powder can be compacted in the bottom of the hole hefore removing it from the cylinder. Thie greatly facilitstee the operation of hlaeting, ae the powder can he placed in the hole without trouhle, whereae, se st present used, it is often necessary to compact it in water, which fills the bottom of the hole, and the powder is conee-quently etirred into a psety maes eo that it will not do full execution.

IMPROVED SLIDE VALVE.—Henry Keseler, S. F., Cal. This is an improvement in that claes of elide valvee, which have a hesring ageinet the top of the steam chest, in order to prevent the eteam from getting above it, and thus permit the valve to move essily without a pressnre of steam upon it. The improvement consiete in employing two packing rings around the upper end of the valve, which are supported on epringe eo as to he held above the upper fsce of the valve. These rings bear sgainet the under side of the cover of the etesm chest, and make a tight joint, thns preventing the entrance of steam above the valve, which is therehy balanced, and the pressure on the seat materially redneed.

MILLING TOOL FOR TURNING LATHES.—Chsrlee Raheskopff, S. F., Csl. Thie ie a tool to he nsed in turning lathes, in place of the ueusl cntter or circular planer with a cutting face for milling down or cutting a stem or rod of any required dismeter from a piece of metel. The improvement consists of an arrsngement by which detachable planere or cnttere can be employed in place of the ordinary fixed or permanent ones. These cnttere are so arranged thst they can he adjustsd to or from the center ae desired, in order to cut or trim a wider or narrower shoulder, with a lsrger or smsller stem, ss required.

STRIPING IMPLEMENT FOR PAINTERS.—D. Lydon and C. Halsey, S. F., Cal. Freshly painted snrfaces may be striped by means of this tool, which consists principally of a emsll wheel or roller which hse a milled edge, and a emall box which is properly plsced to receive the psint which ie taken up by the wheel. A hollow metal hsndle ie employed, at one end of which a metal end piece is eecnred, eo constructed that a portion of it will stand at an sngle to the handle. The angular part is then divided into two parts, and a small wheel is placed hetween them so as to revolve upon a shaft bearing on the metal on each eide. The edge or face of thie wheel is milled. Directly above the wheel is a small metal hox or wiper, the under eide of which is slotted angularly, eo that the npper portion or rim of the wheel will paes ineide of the elot as it revolves. For striping, the tool ie taken in the hand after a fresh coat of paint has been pnt on and the wheel rolled over the painted surface. The milled rim of the wheel will take up the freeh paint and deposit it in the box se it passes through the slot.

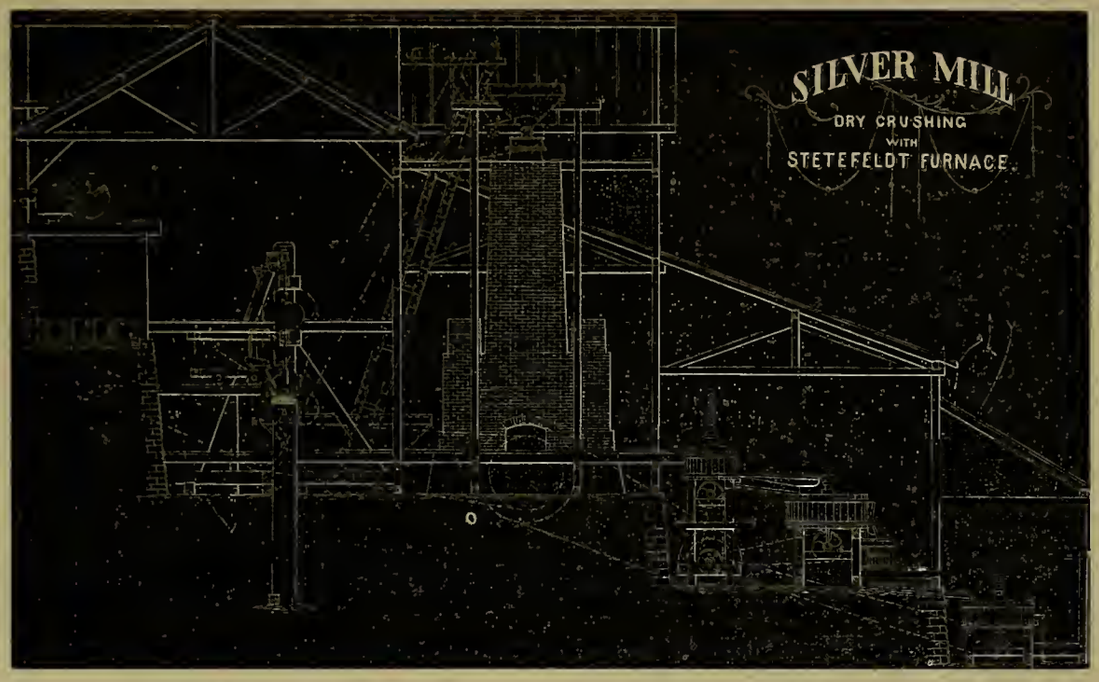
ROASTING FURNACE.—Martin P. Boes, Eureka, Nevada. The invention relates to a novel interior arrangement of that claes of roasting furnacee which are known as upright or stack furnacee, in which the pulverized ore is fed into the top of the stack so as to fsll to the bottom through the flame and products of combustion from the furnace. The improvement consiste of a narrow zig-zag flue in the lower half of the stack and a suspended frame in the npper half which fits inside of the stack. This frame ie also provided with a zig-zag opening or flue which passee down through it. The frame is suepended from a shaft which passes acroes above the stack and from which it receives a jarring or ehaking motion by which the ore is caueed to fall from one incline to the other.

IMPROVED CAR COUPLING.—Elisha T. Barlow, San Francisco. This is an improved eelf-acting car conpling by which two cars can be connected together without the presence of an attendant to enter the link, as the bumpers come together, thus preventing any chance of accidente. It consists of a simple attachment, which can be readily applied to the drawheade at present in use, by which the pin or holt which confines the ends of the liuk in the drawhead is held in the proper position to permit the entering link to antomatically release it and allow it to drop through the link to the holding position. The pin is secured in a frame called a pin holder, which passes down through an opeuing in the drawhead hack of the pin-hole. This pin holder can he raised bodily so as to lift the pin eufficiently to let the link pase beneath it, and a trip lever servee to support the pin holder in place. The entering link forcee the trip lever back until it allows the pin holder to drop and the pin passee through the link eo as to hold it in the usual manner of a link and pin.

Plans of Quartz Mills—Wet and Dry Crushing.

We present to our readers this week two illustrations of quartz mills, one of them arranged for wet crushing, and the other for dry. The cuts were made for the circulars of the Union Iron Works from which we take them.

The most common method of obtaining the silver from its ores is the Pan Amalgamation Process. As in the reduction of gold ores, there are some minor differences of arrangement and practice. The ore is first reduced to pulp by the Rock Breaker and the Stamp Battery, the degree of its fineness being regulated by the texture of the battery screen. When the pulp is to be roasted before amalgamation, the rock is crushed dry. In this case, a drying floor is built behind the battery, between it and the rock breaker. This floor is made of cast-iron plates about three feet by three and one-half feet square, flanged on two contiguous sides, so that all the plates may overlap one another, and yet have a flat surface for the rock on the top. A flue runs back and forth under the floor, the plates being laid on its walls. The hot gases from the roasting furnace serve for heating and drying the ore. From the drying floor the ore is either fed by hand to the batteries, or it is shoveled into the boxes of the self-feeders, which are filled from time to time by an attendant.



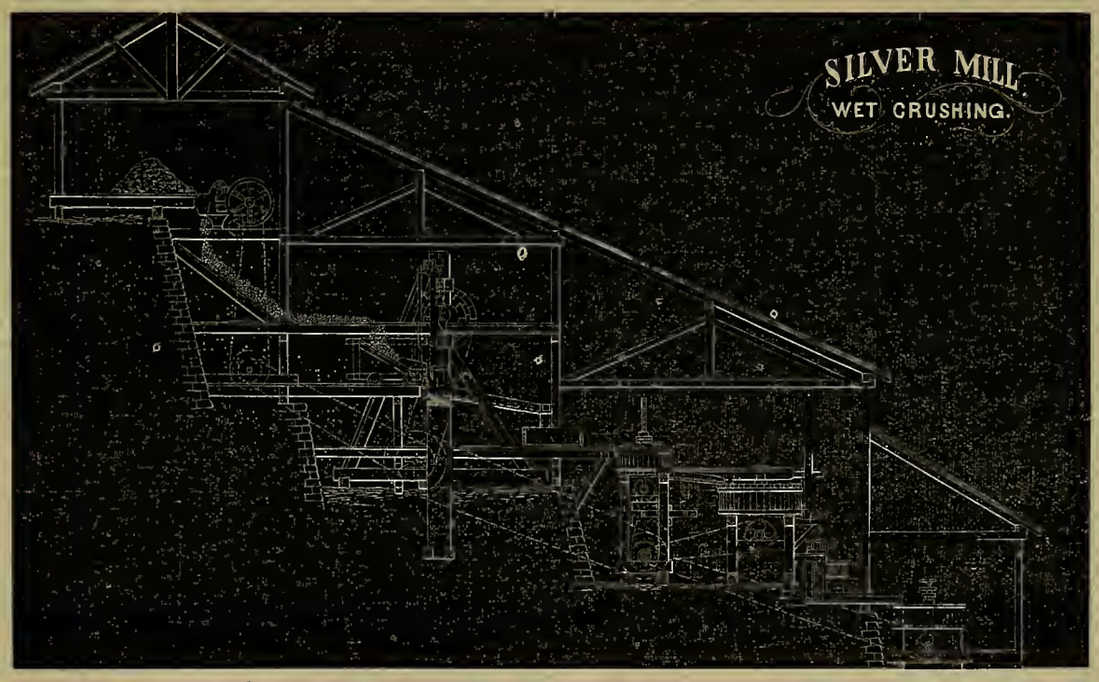
The mortar for dry crushing differs from the wet crushing gold mortar, in that the screens are generally set with more inclination from the perpendicular. The pulp is gathered from the mortars into a screw conveyor on each side of the battery, which transports it to the elevator. The elevator raises it to the pulp feeder of the furnace, into which it is fed, to be roasted and chloridized. From the roasting furnace the pulp is drawn out on the cooling floor, to become cool before being charged into the amalgamating pans. After having been amalgamated in the pan, the charge is run into the settler, where it is washed with water, all the fine stuff running off and leaving the amalgam to be gathered and strained, preparatory to being retorted. In some mills an agitator receives that which runs from the settler, and gathers whatever of quicksilver or amalgam may have passed out of the settler.

The general proportion of pans, settlers and agitators to one another is, two pans to each settler, and two settlers to each agitator, the size of all being dependent on the size of the pan.

In a dry crushing mill, without roasting, the whole arrangement is about the same, with the exception of the furnace and its dependencies. The pulp is received, as at the International mill, which was built in 1870, for the Eberhardt and Aurora Co., at White Pine, in cars, and carried directly to the pans, to pass through the same process as above.

In a mill, crushing wet, the mortar is adapted particularly to wet crushing, and water is fed continuously into the battery with the rock. The wet pulp is conducted into settling tanks, from which it is shoveled, to be charged into the pans and treated as before described.

A Dry Crushing Silver Mill with roasting furnace is shown in the accompanying illustration, which is a drawing of the "Taylor" Mill, of the Mineral Hill Silver Mines Co. (Limited), at Mineral Hill, Elko County, Nevada. This mill is a self-feeder, by Stanford's Patent, and has a Stetefeldt Furnace for roasting the pulp. The rock breaker, set at a point sufficiently high behind the battery, delivers the broken ore upon the drying floor, where it is thoroughly dried by the heat of the waste gases from the Stetefeldt Furnace. From the drying floor it is shoveled into the hopper car of the Stanford Self-Feeder, when all further handling of it ceases, until it is drawn from the base of the furnace shaft. The pulp is delivered from the battery into a conveyor on each side, which transports it to the elevator bin. The elevator is shown reaching from the bin to the pulp feeder on the top of the furnace shaft, which is kept continually supplied by the discharge of the elevator, and is operated by a belt from the counter-shaft. By means of two sets of cone pulleys, the speed of the pulp feeder shaft may be varied from forty revolutions per minute to three hundred. The roasted pulp is drawn from the furnace, by the door at the bottom of the shaft, on to the cooling floor, and is then charged into the amalgamating pans.



The Wet Crushing Silver Mill, is from the drawings of the International mill of the Eberhardt & Aurora Co., at White Pine, recently destroyed by fire. The illustration will be easily understood from the description of the dry crushing mill which has preceded. The International mill had sixty stamps, thirty of which were arranged for wet crushing, as illustrated, and the other thirty for dry crushing and amalgamation without roasting. It will be seen from the cut that the pulp runs from the battery into the settling tanks, and then is passed through the pans, settlers and agitators, as described before.

Utah mining prospects were never more promising, for notwithstanding the advent of winter, large quantities of ore are coming in to Salt Lake. The Cincinnati and Winnemuca mines, in Bingham Cañon, were sold on the 2d to an English company for $400,000. The Emma is shipping, on an average, 500 tons of ore per week from Salt Lake. There is extraordinary activity in working the mines at Snake Creek District, Utah, in which they are building a narrow-gauge railroad.

The Diamond Swindle.

The following condensed report of the statement of Wm. M. Lent, concerning the diamond swindle, will be interesting to our readers, as that gentleman is probably better informed of the history of the whole affair than any one else on the Coast. Mr. Lent first details the different conversations he had with Mr. Geo. D. Roberts, by which he was led to think the investment a good one. The three men whom Robert's party had sent down, had come back with about sixty pounds of diamonds, rubies, etc., of the value of $600,000. Mr. Roberts was very anxious for these men to return again, but Slack wanted $100,000 for his interest before he would leave. Mr. Lent advised Roberts to sell the bag of stones and pay him the cash, to which the latter objected, because the news of the discovery would no longer be a secret. They were afraid to send Arnold alone, on account of danger from Indians. On Mr. Robert's assuring Mr. Lent that the investment was a safe and sure one, he went to Mr. Harpending's and saw the stones, which were displayed on the billiard-table. The same day, or, may be, the next day, I saw Mr. Roberts, and told him that I would not go in, unless I could get some one to go in with me who knew more about the value of those things than I did. He then reassured me that he had taken all necessary precaution about the value by taking (at different times) samples of what was in the bag to noted jewelers of the town. I declined to go in unless General Dodge could also see the stones; so he was permitted to go too. The reason Harpending did not go to W. C. Ralston and get him to join, was that Arnold had objections to Wm. Ralston being interested. When we learned that Mr. Hayward thought well of it, General Dodge and myself determined to invest. We bought from Roberts and Harpending what was represented to be Slack's interest—or one eighth of the whole—for $50,000, with the privilege of taking another eighth, when Arnold and Slack came back from the diamond fields, where they were then going.

The Trip to London.

About the month of August, 1871, I went to Salt Lake, thence to New York and London. During my absence, Slack and Arnold returned with a lot of stones, upon which, at the request of Dodge, Willis paid to Dodge, $25,000, Mr. Dodge telling Willis that it was for the purpose of taking the balance of Slack's interest. I have been informed that Dodge paid this $25,000 to Roberts, and gave for his part his note for $25,000, which was paid through the London and San Francisco Bank. This made me an owner of one-eighth in the property, and cut $50,000. Upon my return to New York from London, in September or October, 1871, I received a telegram from Willis to await the arrival of Dodge and Harpending there, which I did. In a day or two Dodge arrived, and told me that Arnold and Slack had returned to San Francisco from the diamond fields, bringing a bag of stones, and that he had the bag with him. I asked him where was Harpending, when he replied that he parted with him at Omaha; he went by the way of St. Louis, and would be here in a few days.

In a day or two Mr. Harpending arrived; they informed me that before they left San Francisco, Arnold and Slack had returned, and that they had had bad luck; that to avoid suspicion they started in by a new route that in crossing a river the raft that they had built was wrecked, and when they did get to the fields, that they found themselves with only a few days' provisions and a shovel, and the stones they had brought up were the proceeds of 13 days' work with the shovel by two men; that A. and S. had gone back to the fields.

Forming the Company.

We then talked over the business, and they said they had come to New York to form a company on a basis of $10,000,000, and disposing of one quarter for $1,000,000; they had hard work to get Arnold to consent. We saw Mr. Barlow and told him we had a bag of stones worth $600,000 in the Bank of California, and a diamond of 103 carats, for which Shreve & Co. had offered $93,000, and showed him the bag which Slack and Arnold had brought up as the proceeds of 13 days work. We were then told that he could get others to go in, and we were introduced to Messrs. Tiffany, Belmont, Duncan and Seligman. The price of $150,000 was placed upon these stones then and there by Tiffany. About this time Arnold telegraphed that he was coming, and when I expressed a wish to see him personally, Harpending objected, saying as he did not want to sell his interest, he would have hard work to get him to do anything. Arnold came on because there was too much snow at the fields. When Barlow saw Arnold he was convinced of the truth of the whole matter, and appeared anxious to have the company formed in New York.

Changing the Law.

Mr. Barlow said that Tiffany, Belmont, Seligman, Duncan and himself would agree that in consideration of a company being formed, and the company appropriating 1,000 shares of the stock (upon the basis of 100,000 shares, and the privilege of these gentlemen taking one-quarter of the stock at $50 per share, they would agree to furnish the money up to ——, for the purpose of securing the necessary legislation, whereby we could procure a title, as it was decided that there was doubt whether we could hold this class of grounds under the existing mining laws, and if the property could be secured by

[Continued on page 380.]

Camp Floyd District, Utah.

We tranefer to our columns a letter from Csmp Floyd District, which appears in the Salt Lske *Herald*, snd which givee a good deecription of that locslity, ite mines, etc. "We are still as lively as ever in our buey little camp notwithstanding the stern fsct thst winter is fast approaching, or perhsps I might better say, that winter has arrived. The miners are hsrd st work developing their different clsime for the msrket next season, and they hope to continne work during the entire winter, with only an occssionsl interruption of a few days. Thie ie one very decided advantage which Csmp Floyd possesses over some other districts in being ahle to be worked during the entire year, an advantage whi:h cannot fail to he appreciated hy capitslists.

General Improvements.

Several companies which were incorporated this past season, iucluding the Camp Floyd Silver Mining Company, are husily engaged with large forces of men upon their respective properties, and the mines are developing with profitable results. The quartz mill is actively employed pounding away at the ores of the Sparrow Hawk, Marion and Last Chance mines, belonging to the English company, and the bullion constantly shipped to England speaks for itself of the success of the enterprise. The mill has heen running all the time with only two brief interruptions, one in consequence of hreaking a part of the machinery, and again for want of sufficient water to run the twenty etamps; thus compelling a temporary discontinuance of ten stamps. The company, however, is responeible for the deficiency in failing to provide for this emergency hy huilding the necessary reservoirs during the summer season, and I hope the Directors will eee the importance of appropriating the requisite means for this purpose at once. The cause of the deficiency was a sudden evaporation in the spring, owing to the dryness of the past season; hut it is now speedily being remedied hy the late fall of snow, aud the contiuued moist weather is increasing the supply so that the mill will shortly be enahled to resume its full capacity of twenty stamps again.

This occnrrence has prompted some parties to prospect for springs, and I underetand that General Connor contemplates making a water ditch to the camp from a large spring lying west of Cedar Fort eettlement, which, when complete, will supply sufficient water for two additional mills, and for general use of the miners. This enterprise will probably be commenced immediately, and is hound to be a success, like a similar undertaking completed by him at Pioche, where the water was conducted a distance of six miles. Machinery hae also heen ordered by General Connor for the purpose of horing a well near town, so next spring look out for lively times and abundance of water for all purposes.

The quartz mill in process of erection hy Messrs. Baxter & Hussey, at Fairfield, eight miles from thie camp, is nearly completed. It is intended to be a custom mill, and will afford the miners a ready cash market for all the ore they may have for sale.

The Mines.

In order to economize space I append a list of mining claims which have been more or less developed during the past summer with very good results. Western Segregation of the Mormon Chief,, General Morrow, America, Silver Star, Comstock, General Lowe, Michigan, True Delta, Southern Cross, Missouri, Peerless, Jenny Lind, Silver Park, Savage, Elkhorn, Antelope, Shcba, Gentile Belle, American Flag, Red Eagle and Consolidated Camp Douglas. The last named is considered good property, and has a shaft of fifty feet and two opeu cuts, showing a quantity of very good ore, but the company owning it have heen compelled to discontinue working owing to a waut of means; however, I am credibly iuformed that they intend incorporating a stock company, and will probahly arrange eo as to include the Antelope and Elkhorn claims which are considered first-class. By thie means enough stock will he placed on the market to fully develop all these claims into good mines which they are sure to make.

Mines Being Worked.

The minee which are heing worked at present are as follows, as near as I can learn: Silver Cloud with a shaft fifty-two feet deep, cutting a vein of ore at a depth of thirty-five feet. A level has heen run 180 feet on the couree of the vein from the bottom of the shaft, showing a vein of twelve feet of rich milling ore, aesaying from $50 to $2,000 per ton. A tunnel has aleo heen run 275 feet long to cut the vein 200 feet below the face of the shaft. There is also a large dwelling houee, out huildings, smith shop, etc., and a mill site has heen located adjoining the miue, upon which is a fine spring of water. This miue is really one of the best developed in camp, and the company were recently offered $120,000 cash for it, which they declined to accept.

Southwest from this mine comes the English Co's mines, Sparrow Hawk, Last Chance and Marion, on which are employed about fifty men, tunneling, drifting, einking shafts, inclines, etc. The Sparrow Hawk, has recently struck another body of very rich ore. Weet of the English property is the Carrie Steel, which is actively worked by running open cuts and sinking ehafts, and is yielding good qnality and quantity of ore. Next to this claim comes the Safford mine, which has a well defined vein of ore four feet thick, of which a recent assay givee the encouraging results of $40 for the lowest grade and $3,000 for the hest. A large force of miuers ie husily engaged sinking on the lode and selecting the ore. Tbe improvemente on this mine consiet of open cuts and a tunnel some sixty feet long, the veiu stripped for over fifty feet long, ehowing good milling quartz in them all. Adjoining the Safford on the west is the Loue Star, a very promising proepect, as yet hut partially developed, hut from present iudicstions must eventually hecome a good mine. Both these claims are owned hy our jovial friend, Maj. J. D. Woolley of Cheyenne, W. T., who has become lsrgely interested during his short connection with mining in Utah. We welcome and need sll such men of capitsl and energy to develop the mineral wealth of this Territory. North of these ie the Mormon Chief and its extension, Grecian Bend and Londou, which consists of 3,000 linear feet along the lode by 400 feet in width. The developments, in tuunels, cuts, ehafts, drifte aud inclines measure ahout 500 feet, showing a lsrge body of milling ore. This property has already obtained such wide reputation that it is needless to say anything further ahout it, except that it is eoon to be offered on a European market. It is owued hy W. W. Lowe, of Omaha, and others. Further up the hill we come to the Silver Circle aud Wandering Boy, now being extensively worked by S. N. Pike & Co., of N. Y. These two claims have gained quite an extensive reputation, owing to the native silver found in them, and the present workings consist of drifts and shafte done by coutract. Northwest of these claims is the famoue Star of the Weet, owned and worked by a New York compauy, of which Joseph Rau is president. The mine is at present working twelve men, who are taking out a large quantity of ore of very good quality. The vein or qnartz matter ie forty feet in width, aud the ore taken out thus far assays from $25 to $3,000 to the ton. Good houses for the accommodation of the miners and a hlacksmith shop are on the claim, consequently the company is well provided for a winter campaign. This mine is certainly very promising, and will eoon pay a good dividend to the shareholders. Looking over to the eouth side of the town we have the Bismark and Delaware cousolidation, bnsily engaged in sinking down upon their veiu by cuts, drifts and tunnels, and turning out large bodies of good ore. We next come to the Jenny Lind, celebrated as the only cinnabar mine in Utah. There are several tons of ore on the dump, but showing only a small per centage in metal. Work will he vigorously prosecuted until something definite is found, to prove whether it will pay to work it for cinnahar.

I must not omit to mention the Queen of the West, which is also one of our promising mines, and which, rumor saye, has heen sold to a Detroit party for a good sum.

I mnst now conclude my rather lengthy letter, as I fear it has already taken up too much of your valuahle space, by appending a list of mines, some of which have received and others applied for United States patents: Sparrow Hawk, Marion, Last Chance, Consolidated Camp Douglass, Silver Star, Silver Circle Consolidated, Wandering Boy, Star of the West, Silver Clond mine and Silver Cloud mill eite, Red Eagle, Geutile Belle and American Flag."

OSCEOLA.

Smelting Works in Utah.

We take the following from a letter to the Salt Lake *Herald*, dated Stockton, Utah, November 25th:

The smelting worke, owned hy H. S. Jacobs & Co., has three furnaces, a forty-horse-power engine, an extensive supply of fuel, and ahout 1,000 tons of ore on hand, and is receiving daily ahout twenty tons from the mines, the average assay value of which is about 35 per cent. lead, and $120 in silver. When running they use daily about twenty tons of ore, and produce ahout five tons of bullion, which assays on an average ahout 250 to 300 ounces silver and one and a half to two ounces gold per ton, which is shipped hy lake steamer to Corinne and sold to Eastern huyers. They now have 100,000 bushels of charcoal on hand, and an ahundance of iron ore aud lime for fluxes are close at hand. The company exercise great care in properly mixing the ores from various localities, and all the ores going into the furnace are weighed and the assay value known, the weight and value of hullion produced is also known, and weekly reports are made out showing the exact working results, coet, etc. No reduction works in the weet, either furuaces or mills, are workiug ores up to a higher per centage of the procious metals coutained iu them than these, and the actual cost of reduciug the oree as ehown hy careful inspection of the reports is astonishingly small. Ahout one hundred meu are now in the employ of this company in the Smelter and their minee in Dry cañou. Last Saturday, a week ago, the water leading from Soldier Cañon to the smelters failed, whereupon Mr. Jacohs placed ahout forty men to work constructing a ditch to the springs, a distance of a mile and a quarter, which has heen completed through frozen ground, the pipes laid, and water is already running into the furnace tank, thus enabling it to start up again on Weduesday with fair prospects of running all winter.

The Waterman Smelters, also located here on the banks of Stocktou Lake, have been lying idle for some time, hut will be etarted up in a ehort time; they have considershle ore on hand and are conetsntly receiving more. Henry Prosser, an experienced smeltist, will eupervise the manufacture of bullion. When again in motion hie enterprise will receive further notice from me.

The Mining Interest of Calaveras.

The condition and prospects of the mining iuterest of the county at present are, to eay the least, extremely encoursging. The progress of developmeut is not only rspid hut it is also in a direction and of a character that fully aseures stability and permsnency. That which augurs best for the rapid advaucement of the mineral interest of this country is the fsct that the "speculative" system of mining has been generally abandoned, and is succeeded by esrueet efforts towards practicsl development. Men hsve fiually given up the idea thst the eimple ownership of a qnartz ledge, however rich it may be, confers any material henefit unless its wealth be uncovered and utilized. In the past, ownership of a quartz lode iu this couuty has too often meant nothing further than the legal right to prevent its heing worked. In a majority of cases the owners were either unable to develop their possessions or satisfied with sitting idly down in anticipation of prospective wealth. They seemed to believe that the magic wand of capital would eventually turn the leads upside down and pour a golden stream into their laps, when they should have known that labor must first breach tbe walls before the assistance of its ally is required or can he obtained.

Another great drawback has been that what lahor has been performed was done more for the purpose of getting miues in shape for selling than for working. This "speculative" system has not heen euccessful, and the natural result was to retard mineral development and give the county an uufavorable reputation ahroad. More latterly, however, the whole method of conducting miniug operations has heen revolutionized. The great euccess achieved by indomitable energy and perseverance at the Gwin miue, and at one or two other points in the county, has stimulated effort, encouraged emulatiou and awakeued a spirit of enterprise. Men have thrown off their lethargy, ceased dreaming ot wealth and gone to work in good earnest to acquire it. The result is showu, not only iu a very rapid development of mining interests second to those of no county iu the State, but also by a marked improvemeut in business avocations of every character. It ie a gratifying fact that the quartz mining interest of Calaveras has been more materially advanced the past year than during the whole period previous to that time eiuce work was commenced. The numher of paying mines has been quadrupled, and the shipmeuts of bullion iucreased in a much greater proportion. The fact has been demonstrated that lahor, if backed by perseveriug euergy, is competent to make quartz mining profitahle, and the many practical evidences of this truth are the best possihle stimulants to increased effort.

The success that has attended the well directed endeavors of labor has also attracted capital, and there will he no difficulty in obtaining the assistance of tbat powerful auxiliary in the future. But beyond all thie, the progress made during the past year has completely changed the estimation in which Calaveras has heen held among monied men ae a field for profitahle, permaneut investment. With eome of the hest paying mines in the State within our hordere, and favorable development progressing upon every hand, we no longer have it flung in our teeth that "Calaveras ledges are barren." That doleful cry has been drowned in the clatter of a thoueaud stamps that echoes from one end of the couuty to the other, and the unhroken stream of golden ore that flows from them ie significant of what Calaveras ledges are made of. The work of prospecting ie also going rapidly forward. New shafts are heing sunk in all the districts, and it is a noticeahle fact tbat wherever a fair showing is made there is no trouble in getting capital to assist in the work. The unparalleled development of the great Gwin mine, together with the later discoveries at Railroad, and the continued success of operations at Angels and other points in the county, have combined to place Calaveras foremost in the ranks of the quartz mining districts of the State.

Gravel mining is also being much more extensively and vigorously proecuted than it has been for two or three years past. It has heen found that with the greatly reduced rates for water now prevalent that a large percentage of the ground abandoned years ago will pay for washing. At eeveral points in the county extensive hydraulics—similar to those in the northern counties—are being opened, and so soon as the rains set in operations will he commenced on a large scale. In the vicinity of Murphys we learn that a great hydraulic will shortly he started, while within a radius of a mile from Mokelumne Hill three new enterprises of a similar character have been instituted. The coming winter promises to be an unusually lively season, and upon the whole we may safely say that the mining interest of the county is more flourishing and promising than for several years past.—*Mokelumne Hill Chronicle.*

Resumption of Mining at Brown's Valley.

Some years since, says the Marysville *Appeal*, the quartz mines at Brown's Valley, Yuba county, ranked among the best in the State, and yielded largely, hnt for various reasons, principally the general demoralization in the mining share market a few years since, active operations were suspended, and these mines have for several years heen lying idle. Recently a new organization has heen formed under the name of the Brown's Valley Consolidated Mining Company, for the purpose of working those mines, and it has purchased the Jefferson, Pennsylvania and Danehroge mines. The Jefferson, previous to 1865, paid large dividends. The Pennsylvania and Danebroge, located contiguons to the Jefferson, have taken out large amounts of gold, hut we believe have not paid dividends. During the last month active operations have been resumed on these mines by the Brown's Valley Company, and we have good grounds for indulging in the hope that the results may amply reward the enterprise of the parties interested, and also restore the Brown's Valley mining interests to the relative position that they deserve. The new company is composed of San Francisco and Eastern capitalists, with George W. Bowie as President, and W. I. Kip, Jr., as Secretary. The geueral superintendency of the mines is vested in Baron Von Stech, an eminent mining engineer of great experience.

The principal point of present operations is at the incline No. 1 of the Pennsylvania mine, where new and stronger hoisting and pumping works are heing constructed. Knowles' Patent Self-Acting Pumps, capable of throwing 20,000 gallons per hour, are being introduced, and are supposed to be of sufficient capacity to free the mine from water during the time required to make repairs on the machinery. It is the intention of the Company to retimber the inclines, sink them deeper, and extract ore from the bottoms of the shafts and from the side drifts. It will probahly require some two months time and the expeuditure of some $25,000 to get these mines in working order, by which time the mill of sixteen stamps will be ready for work, and it is anticipated that a plentiful supply of ore, yielding $20 per ton, will be obtained to keep it constantly employed. Large quantities of ore are known to exist in these mines, and it is proposed to work them up to their full capacity. Should the yield of ore he in excess of the capacity of the mill for crushing it, the company will erect one of Whelpley & Storer's ore crushers and two pulverizers at hoisting works No. 2, where there is now an engine and other appurtenances, which with the proposed machinery, will give an additional crushing capacity of 50 tons per day.

The Danehroge will he reopened hy a perpendicular shaft 150 feet in depth which will strike the mine below the old works at a place where the vein of the Danehorge and Pennsylvania come together. From these works the drifts south into the Pennsylvania, will opeu this mine at the place where the Pennsylvania hoisting works No. 2 now stand, and where the mine was formerly opened hy an incline 300 feet in depth. The Company has engaged the services of Mr. Joseph Gundry, formerly underground foreman of the Jefferson, and afterwards, in the same capacity on the Pennsylvania, and recently foreman in the mines of W. Watt, Grass Valley. The reconstruction of the old, and ereotion of the new machinery is under the Superintendence of W. R. Eckart, of the Marysville Foundry, where the work is being done. The reopening of these valuable mines is a matter of great importance to Yuha county, and the Company has the hest wishes of the community in the success of an enterprise that will redound to the common benefit.

THE OLDEST STEAMER IN THE WORLD.—The oldest eteamer in the world has heen presented hy her owners, Meesrs. Steele & McCaskill, to the Glasgow Chamher of Commerce. The vessel is named the *Industry*, is 64 tons register, and was launched from the building yard of Messrs. John and Wm. Fyfe, of Fairlie, on the Clyde, in May, 1814. She was the seventh steamer huilt on that river. Latterly she has lain eunk in the East India Harhor at Greenock, but a couple of weeks ago she was floated and heached to he canlked, thereafter to proceed to Glasgow where ehe will be preserved as a memento of the early daye of steam navigation.

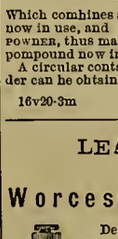
The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER.
Which combines all the force of other strong explosives now in use, and the lifting force of the NEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.



Declared by Connoisseurs to be the only good SAUCE.
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.
2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows;

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street,
San Francisco

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO.
We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent free upon application.

PAUL'S PULVERIZING,
Self-Feeding and Self-Discharging
BARRELS,
For the reduction of ores, dry, to an impalpable powder or any given fineness, are made of any capacity—4, 6, 10, 20 or 50 tons per day. The reducing material is quartz from mine working upon coarsely-crushed ore from batteries or other machinery. No ore discharged for amalgamating that does not pass through wire cloth having eight thousand and one hundred holes to every square inch of surface.
The practicability of these barrels are established by the working of hundreds of tons or ore. Several are now building at the Miners' Foundry and can be seen by those interested. For particulars appy to

[Continued from page 377.]

Sioux scrip, that they would bny that, the property in the Spring to be examined hy an expert of their selecting, and if he approvod of the property, they to pay the $1,000,000.

Arnold Wants "Cash on Delivery."

This was agreed to, hut Harpending said that he would have to see Arnold. The next morning he said that Arnold objected unless he had something paid down, eaying, "Suppose I go in the spring, and the men they select say the gronnd is not what I have represented, my secret is known, although the property might he worth more, and he richer than I represented; he would not do it. He (Harpending) might trust these men if he wanted to, hut he (Arnold) would not, and he would not sign any paper unless he had a payment on his share of the interest he was interested in, which was one-sixteenth of the whole, and unless he was paid $100,000 down he wonld leave the city and take the hag of stones, valued at $150,000 with him." Here was a dilemma. At this time I helieved the amounts we had in hand were $650,000 or $750,000. I offered to advance $50,000 if I conld get the hag of stones for security. I telegraphed to Ralston that I was going in for $50,000 and he might join me and take a like amount himself. He telegraphed hack $100,000 saying, take $50,000 each. This was part payment to Arnold on 2,650 sharcs of his stock, leaving $150,000 to be paid on his return in the spring. I paid Arnold this money and deposited the stones with Dnncan, Sherman & Co.

Mr. Lent's Confidence.

At this time I was confident of the safety of my money, for, making allowance for one-half, there was value enough in the property. After this Mr. Harpending went to Europe, Mr. Dodge returned to New York and I retiurued to San Francisco. I was ehortly afterward recalled to New York on private bnsiness, and after etaying there two weeke, eailed for Europe and arrived in London about the 24th of January, 1872. I saw Mr. Harpending a few days after and he told me that Willis and Boyd had eent a man to Arizona to find our property. Mr. Harpending had received a letter from Mr. Roberts saying that he had no doubt hut that I was in the Willis and Boyd operation, and urging Mr. Harpending's return. Knowing my innocence in the matter, I came to the conclueion that Roberts had coined this etory for the purpose of having him come on. Even after these letters, the indifference with which Harpending acted in this business made me feel gloomy, and I wrote to Dodge and Willis that if it were not for the stones I had eeen, and Roberts' lettere to Harpending, I would make up my mind that we had heen eold. I then left England and arrived in New York on the 29th of April.

Selecting the Expert.

The party first tried to get Mr. Benjamin but he was away and conld not he procured; in consequence of this Mr. Seligman would not go in. Mr. Jauin was then selected, who would make a report for a cash fee and a privilege. I offered him, I think, $1,000 and a privilege in 1,000 shares of stock at $40,000. Before I eaw him again Dodge and Harpending offered him $2,500 and the privilege of 1,000 shares at $10, at which I was very much put out. About this time, we learued hy telegraph that Mr. Boyd for myeelf and Dodge, E. M. Fry for Ralston, and Jos. Roberts for his brother, would, by prior arrangements with Arnold, meet at Denver, where they expected to join the party.

Mr. Harpending objected to go into the field with a California party, viz: Boyd, Fry and Roberts. I eaw Arnold and Slack for the firet time at Denver. I also met at Deuver, Fry, Boyd and Roberts.

Glowing Accounts of the Diamond Fields.

I left San Francisco for New York on the 12th of June, 1872, about June 20th, there was a telegram in cypher received hy Mr. Barlow, in New York, signed by Janin, Dodge and Harpeuding, giving a glowing account of what they saw. This dispatch was dated Cheyenne, and said, "they had just struck the road." He told me how Janin had behaved so well, and wanted to telegraph to hie friends to buy etock, etc. He also told me that all that had been told by Harpending about Arnold was false; that

Arnold was a Good Man,

And he did not helieve that he wonld deceive any one. On the 24th of June, 1872, I met Harpending near the office of Lees & Waller. He took me to see Janin who assured me that we had a hrilliant property. We went out and met Dodge, and proceeded to Barlow's office, where Harpending produced the hag of etones. Janin gave a description of the country and his trip, and said it wae necesseary for him to know the value of the stones he had brought to enable him to make his report. We weighed the stones and (not counting the ruhies anything) the result was, at $35 per carat—about $30,000.

Why the Parties Returned so Soon.

Duncan eaye: "Why did you come back so eoon? It appears to me that you were more in a hnrry to get back than to remain and pick np diamonds." Janin said that he had finished his work, which was to prospect the ground, and that General Dodge was taken ill, and tbat Mr. Harpending was anxious to return on account of the expected illness of his wife. Harpending, at thie time, was with us. I had hut little to say to him on acconut of his not taking in the Denver party. I was told that Ruhery and Slack would remain on the ground until our party could get in. After my return to San Francisco and after the formation of the company. I learned for the first time that this was not so intended, and that Dodge and myself, for some purpose nnkuown to us, were deceived.

One Million per Month.

About this time, June 1872, Mr. Lent appears to have snspected a "hear" movement from certain circumstances which he details, Heid, Tiffany's man, valued the stones at $8,000. Janin said that, give him twenty men, and he would produce a million per month. Mr. Janin now suggests that I am mistaken, and that he said, "Give him twenty men, and he will send up the first thirty days after he gets to work one million." I may have been mistaken, and therefore give Mr. Janin's correction. At this meeting Mr. Tiffany reasserted to Mr. Janin the value of the stones at Duncan's was $150,000.

Mr. Harpending's Desire for Control.

On the 26th of June I learned that Mr. Dnncan refused to take the interest agreed upon; that we must have $150,000 to meet our obligations to Arnold and $30,000 more for a working capital. I urged the propriety of hringing the whole thing to San Francisco; that this property we had known of for nearly eighteen months, and Mr. Janin had examined and reported on it; upon that report and their own statements I was convinced that San Francisco was the place for it. I also, in proposing that the business go to San Francisco, made remarks about what I thought of the moneyed men of New York, which are useless for me to state, as they had no effect at the time. Mr. Harpending said he had three-fourths of the property and wonld control it. I was disgusted and bonght my ticket for San Francisco, only waiting for an answer to a telegram from Ralston. That same day Janin agreed to go to the field with Arnold. I told them there was no douht of the valne of the property. Harpending would not listen to me but hoasted of his representing the greater iuterest. Arnold had ue in his power at that time as the discovery claim was in his name and he would give no deed unless he got $150,000.

Mr. Lent's Opinion of the Property.

I will give you an extract from my letter to Mr Willis to show you my opinion of the property:

"To sum up this hnsiness—Arnold and Slack are all right and have been true in every particular. Dodge and Janin hoth hear the strongest testimony of the valne of this discovery. 'There is not the least doubt,' Janin says, 'that $4,000,000 is no price for the property,' and I never knew Janin to take so much interest in anything as in this. He ie anxious to have it floated here, while I am not; his reasons are, that if it wae made known there in San Francisco, every one wonld go. I told him the same results would follow if it was floated here, as eoon as it was known. Janin thinks it worth Crown Point and Belcher combined. Now, Arnold is at Louisville and wants his money, and told Harpending, as soon as yon are ready send for me. I have $25,000 here, and in case of need will draw upon you for $110,000 in gold and take the business into my own hands. Ralston can join me in this last or not, as he pleasee. I told Barlow that if his clients were afraid, if they would put up $750,000 I would put up $250,000, and my $50,000 should lay as security to cover the lose, if they would divide the profits."

Mr. Harpending met us at Lees and Waller's and offered to take $250,000 worth of the stock, if we would give them the privilege of 25,000 shares in ninety days at $50. At the time he made the offer, he, as a friend, advised us not to accept it. I thanked him, and told him "No." Butterworth thought well of the property. I asked him why he did not go in. He replied that he had just received a letter from Charles Brenbam that he had loaned all his spare money for a time at one per cent. When I told him that I would like to take the loans up to $100,000, he made no reply. At this time I thought that the parties we were treating with were trying to get our property in their own hands.

The Scheme to be Taken to San Francisco.

Thie day all were working harmoniously. On this day or the next I received a dispatch saying, "Close all negotiations with New Yorkers and come out." Ahout this time a copy of Janin's report was received in San Francisco. I telegraphed to Willis and Boyd for their private opinion as to taking the property to San Francisco. My telegram was in the following language: "Taking Janin's report as your basis, what is your private opinion about taking the hnsinese to San Francisco?" My reply was favorahle to doing so. The report of Mr. Janin was my basie of action from that time out. About this time I received dispatchee saying that the propety could be placed in San Francisco, and telling us to come right out with it.

Retrospective.

I will retrospect a little. Accompanying Janin's report which I sent to Mr. Willis, I wrote him a letter, dated June 28, 1872. which I told him to show Ralston. Upon the receipt of this letter, Willis or Ralston telegraphed me that Ralston would take the property on the terms of my letter, which were as follows: For Willis, Boyd and myeelf to take the $1,000,000 of stock ourselves in greenbacks; and if we could put it on the market at the same price in gold, we would make money ont of it.

After the receipt of Janin's report, Ralston, Willis and all were interested very mnch to have the property bronght on to San Francisco; and to aid me in bringing it here, Mr. Ralston, in a telegram to ns all (Dodge, Harpending, Roberts and myself) gave a guarantee that he would take the property and pay for it iu five days after our arrival. His assertion was hased on Janin's report.

The Expert's Share.

In July Mr. Janin bad the privilege on 1,000 shares at $47 and 1,000 at $40, and the 1,000 shares on which he paid ten dollars. He remarked to me, 'I did think I would sell 1,000 shares at $40, bnt I will not do it. I will hold for an advance, as I am satisfied that my first six weeks' work will astonish them all; and when you go out, I want you to go after any one who croaks at my report, and I will give them a chance to bet ou my proposition." At this time he offered to het me that in six weeks after he arrived on the gronnd he would bring with him one million of dollars in diamonds.

Mr. Lent then details the manner in which the stock was withdrawn from New York and put upon the San Francisco market.

Arnold's Benevolence.

Arnold lived with Harpending at this time, and appeared to have a strong friendly feeling for his family. I was anxious to have him leave. Mr. Harpending came and told me that in consideration of what Arnold had made out of the business, he (Arnold) wonld give Mr. Harpending 15,000 shares for $300,000 if he could get some money, and Mr. Harpending wanted Mr. Ralston to have an interest, and this was accomplished hy my giving him a check for $75,000 (39,000 of which Harpending horrowed for me from his father) and a draft for $75,000 on Mr. Ralston with a letter advising him what I had done.

Before I left I drew on Mr. Ralston for the expenses of outfitting Janin and Arnold; and on Thursday Harpending, Ruhery and myself left for San Francisco, leaving Dodge with Janin, in New York, aud Arnold goiug to Kentucky to hire twenty negroes. With this force he was to joiu Janin at some point on the road, where they would go on together.

Janin Clings to the Belief that the Property is Valuable.

Before I left New York I had frequent conversations with Janin, and he never faltered for a moment in his estimate of the property. He obtained a promise from me that I would secure to Gashwiler 1,000 shares at $40, saying: "I will write him not to fail to take the stock." This letter was sent by me. He said, "I would telegraph him, but he would go and buy at any price, and I am anxious to secnre 1,000 shares for him at $40." The day before I left, Mr. Barlow informed me that he had $100,000 euhscribed I told him to remit it to Mr. Ralston, which I understand he did the day after my arrival. We left then for San Fraucisco, where we arrived the latter part of July. Upon my arrival I saw Ralston and informed him what I had doue, and of the purchase made hy Mr. Harpending. Mr. Ralston told me that all who had read Janin's report were satisfied and would take their stock. I called upon my friends and nrged them to take the etock, hecause I was fully impressed with the value of the property. In a few hours the 15,000 shares were taken, and Mr. Ralston called Dore, Harpending, Roberts and myself together. He asked us what price we wanted to fix 6,250 shares. Mr. Harpending did not want any of his sold less than $100 per share. The next morning the newepapers came with the expose, and the sale of stock was stopped. We then agreed that we would not sell at any price until we had heard from Janin.

A California Company Formed.

A company was formed, and I was elected its President. Ahout thie time, we heard tbat Janin was on the road bnt being watched, was afraid to go to the field. Mr. Ralston sent for me, and said something must be done. He asked me to give him authority to organize a party to visit the grounds; I consented. After the Roberts party left, there came cahle news saying that our stones had been bought in London. This news I thought was a trick of the trade. Ahont this time I learned that Mr. Harpending held a power of attorney, and had eome $200,000 of Arnolds money to invest. A few days after we had received the news from London, Mr. Harpending informed me that he had placed Arnold's $200,000, in the Bank of California in such a way that he could not get it, if the diamond fields should not turn out as represented. It reassured me that all was right.

Another Party Sent to the Field.

On the——day of——, 1872 letters were received that convinced us that the Roberts party, was lost and and another party, to be headed hy General Colton, assisted hy Janin and General Dodge (who consented to pilot the party in, if Arnold could not be found), was formed. Telegrams were sent to where Arnold might be fonnd. On the next day an answer wae received from Arnold asking, "What do you want?" This wae replied to hy the request that he wonld meet General Dodge at Laramie: and answer promptly came, "I leave to-morrow" The promptness of Arnold to respond removed all doubt, if any then remaiued. General Colton and party passed the Roberts party on their way down.

The Party Recalled.

The Board met and received reports from Roberts who urged ue not make a move until Spring; and contrary to the judgment expressed by the whole Board, the party was recalled. At this time Dodge and Arnold had joined the the Colton party on tbe road.

Arnold Gets his Coin and Leaves.

Arnold came to the city, and demanded from Harpending the return of his money. Harpending informed him that he had invested it, and where he had placed it. Arnold then demanded his power of attorney, and imformed him that General Dodge would hereafter act as his agent. Harpending was doing his best to keep the money. In the end Arnold obtained his money and left for the East. Now we have the Roberts party in town, and the Colton party also returned. On the 10th of November it appears that Clarence King called on Janin, and informed him of the result of his visit to the fields. Mr. Janin introduced Mr. King to members of the Company. Janin aud Colton, accompanied by King, returned to the fields. The first intimation I had of King having been in the field was on Friday, the 22d November; the Company met, and the reports of King, Colton and Janin were received, and referred to a special committee. The result of Mr. King's report is well known.

MARIPOSA MINES.—The entire Mariposa estate is now lying idle with the exception that a dozen men are running a drift in the Josephine or Pine Tree mine.

BORAX.—Heavy machinery is shortly expected from the East for the Saxon American Borax Company, of Hot Springs, Napa county, Cal.

BELTING.—The New York leather belting manufacturers have resolved to raise the price of belting two per cent,

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Marsh Fevers, often auplpantiag the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulu

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Prepared and sold by JAMES G. STEELE & CO.,

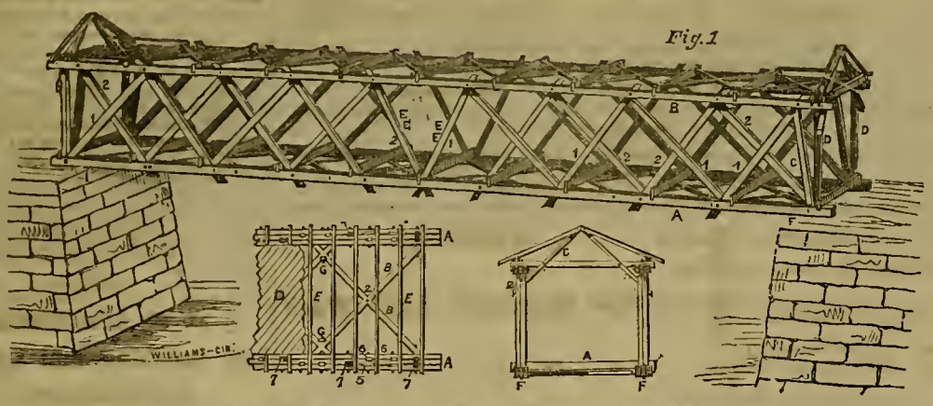
Fig. 1



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary. **W. H. GORRILL, President.**

H & L AXLE GREASE.

TRADE MARK H&L AVOID IMITATIONS

The attention of Teamsters, Contractors and is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

Building Fronts, Water Pipe
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or leened, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short snd concise descriptions of various processes and apparstus employed in thie country and in Europe, and explains the why and wherefore.
It contains 142 pages, embracing Illustrstions of furnacee, implements and working appsratus.
It is a work of great merit, by an author whose reputation is nnsurpassed in his speciality.
Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Oree generally, with 120 Lithographic Disgrams. 1867.
This work is unequsled by any other published, embracing the subjects trested. Its authority ie highly esteemed and regarded by its readers; containing, as it doee, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minersls, which cannot he found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extrsction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final caeting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.
As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.
Price, $5 in cloth; $6 in leather—coin.

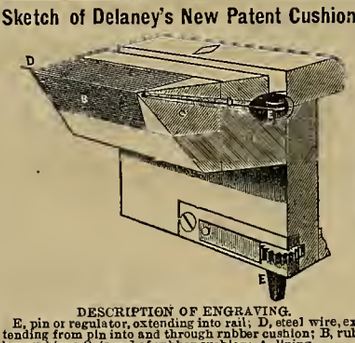
BY OTHER AUHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Aessyed, and How Worked: with a Chapter on the Blow-Pipe Assay of Minerals By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the eubject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most ressonable rates by DEWEY & Co., Mining and Scientific Press Office.

Sketch of Delaney's New Patent Cushion.



DESCRIPTION OF ENGRAVING.
E, pin or regulator, extending into rail; D, steel wire, extending from pin into and through rnbber cushion; B, rubber cushion; C, is end of rnbber cushion; A, lining.
Their construction is of the simplest kind, thus making no heavy expense for suppoeitous elaboration. The improvement is a steel wire running lengthwise, and communicating with a pin at each end and inside of the rails; the wire is imbedded in the rubber cushion, near its edge or surface. The pin mentioned is controlled and operated upon by a key, regulating the tension of the wire, according to the necessities of the case. It keeps the edge of the cushion straight and sharp. It prevents the rubber hardening from the impingement of the ball; and, above all other considerations, the angles are bonnd to be perfectly correct.
The ball never jumps from the table, however severe the stroke. It makes no noise when leaving the cushion.
Nine cushions are made npon one tables with the same degree of force reqnisite to make six upon any other.
These unrivalled cushions are self-protective, and will retain their elasticity either in hot, cold, dry, or damp weather, almost forever.
Thonsands of Delaney's cnshions have been introdnced throughout California and the Great West, where the largest billiard manufacturers now make exclusive nse of them, to the eminent satisfaction of their patrons.
Sole Agents for the Pacific States, China, Japan, Sandwich Islands, and Anstralia.

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS,
SAN FRANCISCO, November 25, 1871.

SEALED PROPOSALS FOR FURNISHING CERtain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of Janusry, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;
Stone for Facing of Basement Story and Building the same in the Walls, ete;
Rolled Iron Joists;
Iron Girders and Colnmns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc;
Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule. etc., and Plans and Drawings.
The Printed Specifications and Printed Forms of Proposals csn be had on application to the Secretary, snd the Plans and Drawings can be seen, and all further information—as to the details of the work, etc.—can be obtainod from the Architect, at the office of the Board.
The Bids must be endorsed for the Material proposed to he furnished or Work done, and addressed to the Secretary of the Board.
No Bids will be entortained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or bond with two good and sufficient surelies, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the due entering into the contract of the psrty to whom it may be swarded, or to be forfeited, if the party fail to enter into the eald contract.
Each bidder for Brick will state what qnantity he will furnish within one year, and at what times he will deliver them. Samples must accompany each bid.
The Board reserve the right to reject any or all bids.
Paymenta will be made monthly in "City Hall Warrants," of 75 per cent. of estimated amounts due, and the remaining 25 per cent. when the contract is completed.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 21, 1872.

VOLUME XXV. Number 25.

Christmas.

Americans recognize but few national holidays. Certain sects of Christians, however, have numerous holidays, but they are generally devoted exclusively to religious and devotional exercises. But Christmas as a holiday is an exception, and though, as with our Thanksgiving day, religious exercises make a part of the programme of observances, more particularly with the Roman, Greek and English church sects of christians, in which praise is offered to God for his infinite goodness and mercy, in giving to the world the Saviour, whose nativity or birth they celebrate on that day; yet custom has, from the earliest times, made it a day over all other church holidays, as one devoted to reunions, merry makings, joyous givings, peace offerings and good cheer, in which the old and the young participate.

Yet, though the veteran Christian on this day may have his thoughts at intervals turned to the contemplation of the Infinite, and the Author of the Great Redemption—our observation leads us to believe, that with the masses of the so-called Christians, the larger share of thought is bestowed on gifts, wines, turkeys and good dinners; and that, particularly with the young, Santa Claus is the hero and divinity of Christmas, for

"When time comes round, a Christmas-box they bear,
And one day makes them rich for all the year."

And it would seem that merrymaking and feasting are equally legitimate, having their precedent established and recorded far back among the Christian centuries, when it was said:

"At Christmas play, and make good cheer,
For Christmas comes but once a year."

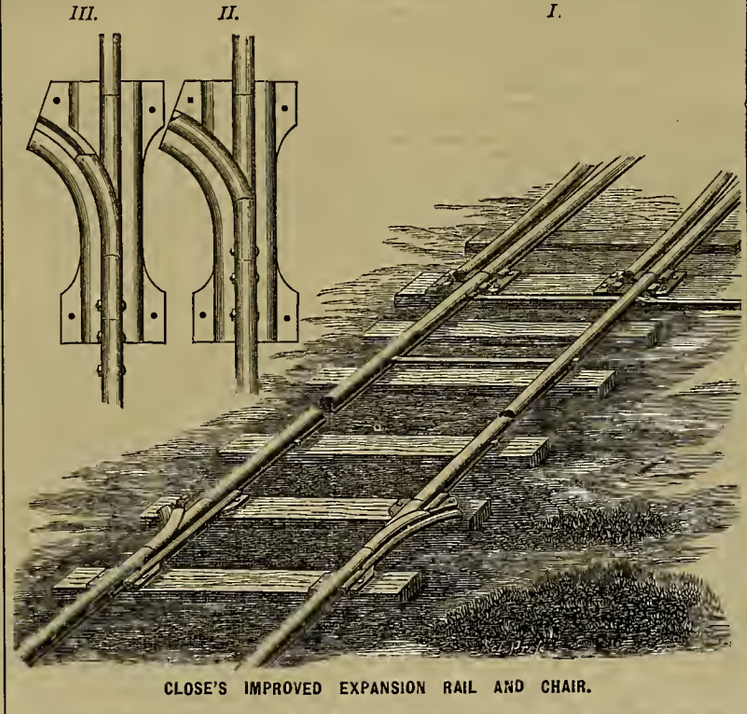
And now as the day will be upon us before another issue of the PRESS, we wish our patrons and readers, all, a Merry Christmas.

OUR MINING SUMMARY.—The Nevada *Transcript* finds fault with us for giving a "slim review of the mines of this State and paying a great deal of attention to mining interests abroad." Our weekly mining summary is compiled and condensed from reports published in the papers representing certain localities, and we always endeavor to give as full a notice as possible. A number of the interior papers in mining districts have a weekly summary of mining news, but some of the local papers pay much more attention to political and general topics than to local affairs. We always copy any news of interest in the California papers as well as others, but find more difficulty in making up our summary of California than of all the other States and Territories put together. The only reason is the scarcity of items in the local papers. If they do not pay enough attention to their immediate interests to give the mining news of their respective localities, we are unable to get it. Full credit is always given for any items used, and perhaps it would be difficult for the *Transcript* to look over our files, for some time back, without finding almost every mining item it has published, and all that were of general interest. The Nevada papers publish very full weekly summaries, so there is never a dearth of news from that State, but, as a general thing, the California papers are negligent in this respect, and we find it difficult to procure much mining news. Let our interior cotemporaries pay a little more attention to this matter than they have been doing, and they will oblige the general public, and the miners themselves, as well as us. We desire to represent the mines of California fully in their fairest light, and endeavor so to do; but beyond occasional correspondence, and that of our regular traveling correspondence, we have to rely on the interior press for our news.

Improved Expansion Rail and Chair.

One of the most serious difficulties to be met with in the maintainance of railroads, is that caused by the alternate expansion and contraction of the rails from heat and cold, and the "crawling" or moving in one direction of the track, either on a grade, or by reason of the moving of trains constantly in one direction, as in the case of double lines of track.

Many ingenious arrangements have been devised for the purpose of overcoming these difficulties. Among the objections to previous inventions may be mentioned the necessity for constant attention and adjustment; open spaces left at the ends of the rails making a weak joint; and such an arrangement of the joint as to prevent a full bearing of the wheel upon the rail. This latter fault is a grave one, and causes the ends of the rails to be so battered and broken, as to become worthless in a short time.



CLOSE'S IMPROVED EXPANSION RAIL AND CHAIR.

Our engraving to-day presents views of an expansion chair, invented and patented by Mr. William Close, of Sacramento, which meets all the requirements of a perfect expansion joint. It is automatic in its action; always presents a full surface of the rail to the wheels, whatever may be its position, and may be applied, not only to switches, but to the track on long bridges, or at any point affected by the causes mentioned above.

These chairs have been thoroughly tested on the Central Pacific Railroad at Sacramento, and on the Virginia and Truckee Railroad, demonstrating the fact that in addition to accomplishing their object so far as counteracting the action of heat and cold upon the track, is concerned, they are durable and safe to run over at any rate of speed.

Fig. 1—Is a view in perspective showing the application of the Expansion Chairs to a switch, the "throw rails" being represented as broken in the middle to shorten them sufficiently for the size of the cut.

Fig. 2—Shows a plan of the Chair with the joint closed, and Fig. 3, shows the joint opened.

The principle, as will be seen, is that of making a curved section of the rail which moves in a groove, curving outward from the line of the track, so that the latter is a tangent to the curve.

The curved section meets the straight part of the rail having a short straight section jointed between the two, so as to allow sufficient motion.

When in place, at a switch, any expansion or contraction will be taken up by forcing the curved section out, or drawing it in, and the switch rail is thus relieved from the pressure which would otherwise cause it to bind, and necessitate the cutting off of a piece of the rail in one case, or would leave a large open space at the head Chair.

On bridges or other places where required, aside from switches, the single Chairs can be used or the capacity can be doubled by a curve, in each direction on the same Chair.

From 6 to 9 inches of expansion can be taken up by a single Chair.

Any further information can be obtained by addressing the inventor, or Mr. J. R. Wilkinson, Sacramento, Cal.

UTAH ITEMS.—They have been having some storms in the mountains back of Salt Lake this week, but the weather in that city is still pleasant. Transportation is said to be wholly insufficient for the greatly increased amount of ore in the cañons. Work on the Brigham cañon and Little Cottonwood railroads is progressing rapidly, and the cars are expected to be running before Spring. Very favorable accounts are coming from the mining districts, and there has never been known before in Utah, such activity and promise of the mining interest.

NARROW GAUGE.—A council of citizens is called at Corinne, to build a road from the Utah Northern Narrow Gauge line to that point.

The Coming Course of Lectures.

The Quarterly Meeting of the Mechanics' Institute was held on the 14th inst., and the President's report read. The Regents of the State University have made arrangements with the Trustees of the Mechanics' Institute for a course of Saturday Evening Lectures on the plan similar to that of last year, and the President's report announced the following appointments:

Two lectures to be delivered by President Gilman, on January 4th and 11th—first, on "Polytechnic Schools at Home and Abroad," and second, on "The Physical Geography of the United States in relation to its History." Five to be delivered by Professor John Le Conte, on January 18th and 25th, on "The Distances and Activities of the Stars;" February 1st, on "What We Breathe;" February 8th, on "What We Drink;" February 15th, on "What We Eat." Two by Professor Joseph LeConte, on February 22d and March 1st, on the "Ancient Glaciers of the Sierras;" one by Professor Kellogg, on March 8th, on "Homer and the True Homeric Poems;" one by Professor Rising, on March 15th, on the "Physical and Chemical Properties of Water;" and one by Professor Swinton, on March 22d—subject to be announced.

As we have stated before, a fee of one dollar will be charged for the entire course, subject to the rules heretofore in use. The topics are well chosen and will be interesting to all. We hope to hear of a good attendance at these lectures, as the gentlemen selected are fully able to handle the subjects in a popular and comprehensive manner, while at the same time they will be sufficiently scientific to please those who are interested in technical details.

THE DIAMOND FRAUD.—Dispatches have been received in this city, stating that Arnold, of "salted" diamond fields fame, and whose property in Kentucky was recently attached by Wm. M. Lent, on account of the recent diamond swindle, has published a long defense in the Louisville *Courier-Journal*, denying the charges and saying that he never sold a dollars worth of property to Lent, or had a contract with, or received money from Lent at any time. He alleges that the discovery was honestly made, and the transactions in regard to it were all between himself, Slack, Harpending and G. D. Roberts, and were all fair, and after a full investigation by all parties. He further alleges in his statement that the charges against him are made by a powerful and unscrupulous ring, guilty of many swindling mining transactions.

It is also stated that Wm. Wilson, a prominent lawyer, is on the way to this State to bring a libel suit in behalf of Arnold, against the parties interested with charges of swindling against him. Arnold makes some very foolish assertions about having discovered enormously valuable mines in Kentucky, which he values at hundreds of millions of dollars.

AMERICAN FLAT TUNNEL.—This tunnel, on the Virginia and Truckee Railroad, which was destroyed by fire on the 17th of October, is again in order. The connection was made on the night of the 16th inst., and trains can now run from Reno to Virginia without detention. The tunnel is 585 feet long, and has been lined with zinc to protect it against fire. The interruption of traffic caused by the accident to the tunnel has had a serious effect on the Washoe mines, causing a scarcity of wood, supplies, etc., and every effort has been made to repair it as quickly as possible.

Metallic Staples of the Pacific Coast.

What was the phantom that haunted the minds of the human race through many ages? The belief that there existed a land, hidden from the gaze of the majority of the sons of men, where illimitable riches prevailed, where there were no poor, where the houses and temples were of gold and silver, where arms and armor and the commonest utensils were formed of incomparably the most precious of metals. The causes of some of the most remarkable revolutions of the world may be traced to this universal belief and to the all-absorbing passions to which it gave rise. The earliest expedition of the most famous people of Europe, that which gave rise to their commerce and subsequent splendor, was the search for the El Dorado—the fabled golden fleece of antiquity; the same idea inspired the minds of the northern hordes that trampled the Roman Empire to the dust; it led the Mongols from the depths of Asia to the conquest of the earth; led Columbus to the new world, Cortez and Pizarro to the conquests of the Indies and Peru, De Soto to the discovery of the Mississippi, and gave world-wide fame to the chivalrous and adventurous Sir Walter Raleigh, who spent the best years of hie life in the unavailing search for the sams El Dorado—the city of the Gilded One. And considering the wonderful development of the last twenty years by the waters of the Pacific, it is, we think, too much to assume that the universal belief of ages was founded entirely on a myth. There may at least a doubt remain as to whether it was not founded on the actual knowledge and existance of the races who lived five thousand years ago. The discovery of the existence of the ante-historical race of the mound builders may make us at least cautious in determining as to whether our mines were not known and worked untold centuries before the advent of the red man to this continent. Familiarity breeds contempt, and lack of information too, and how many are there among us who can thoroughly realize to themselves the value of the

Amazing Quantities of Gold and Silver

Extracted during the last twenty-seven years from our placer quartz mines and lodes of silver. That amount cannot be ascertained to such a critical nicety as to satisfy the over scrupulous statistician, but counting the value of bullion exports, comparing them with the receipts as far as they have been published, and making due allowance for gold taken from the State by hand in the form of dust, nuggets and by those who wished to dispose of it at better rates elsewhere, or to amaze their wondering friends, wives or sweethearts East or in Europe by the eastern shore of the Atlantic Sea, we find that this coast, principally California, has produced gold and silver worth the almost incredible sum of one thousand two hundred and nineteen millions of dollars. It is not easy to realize the significance of these figures. They represent the entire real and personal wealth of the nation, for in the course of trade every one of these dollars is made to represent twenty times as much real estate or personal property. The annual yield of our mines has never fallen below fifty millions of dollars, and has most frequently surpassed it—in the year 1853 being estimated at a value of seventy millions of dollars. Of the whole value, at least four-fifths have been gold, and the remaining one-fifth silver, obtained in small quantity in California, but mainly in Nevada, and principally from

The Wonderful Mines of Comstock,

Whose yield in twelve years have added to the argentiferous wealth of the world the almost incredible amount of one hundred and fifty million ounces, representing about the same number of dollars. Discovered in 1860–61 and yielding in the latter year bullion to the value of six million dollars, it reached a yield of twelve million dollars in 1863, and sixteen millions in 1867. Enough gold and silver have been raised in the Pacific States since 1847 to give two thousand dollars to every man, woman and child in the State, and six thousand dollars to every male adult. With such an abundance of wealth, our people have been remarkably liberal; they have not kept their treasures by them, but have sent them to every part of the earth in exchange for luxuries formerly accessible only to kings and princes. By much the greater part of our bullion has been exported. We have got rid of in this way up to the present time

One Thousand and Thirteen Millions of Dollars.

In the first two years of our existence we sent abroad in this way sixty-six millions; in 1851 and 1852, over ninety millions; and since then amounts equaling in value from seventeen to fifty-five millions seven hundred thousand yearly,—the latter, the largest export, having taking place in 1864. Of the total, the East has taken the largest share,—over one-half, not less in round numbers than six hundred millions of dollars having been sent thither since 1850. One hundred and ninety million dollars has been poured into the bank-vaults and coffers of Great Britain during the same interval. China—that reservoir of the precious metals, into which, as the waters of great rivers pour into some giant lake without outlet—has taken over seventy-seven million since 1855. Of the balance, we have sent about nine millions to Panama, nearly one million dollars to the Philippines, seven hundred and twenty thousand to Mexico, one million seven hundred thousand to Central America, about a million and a half to the Sandwich Islands and to Chile, and the balance to Australia, Peru, Calcutta, the Society Islands, Havana, British Columbia and various other countries. California and Nevada have thus been the golden and silver sources whence

Rivers of Wealth

Have poured over nations—over continents, and these sources, be it remembered, have been ones that never have failed or materially lessened for a quarter of a century. Of this great outward flow, of these Plutonic streams, a considerable proportion, particularly of late years, has consisted of

Coin,

Particularly of gold coin, for the greater part of the silver has been exported in the form of bullion. About one-fourth of all the gold discovered on the coast has been coined in San Francisco, and a much larger proportion in the other Mints of the United States. The value of gold coin issued from this Mint up to the beginning of this present year has amounted to $312,681,713.04, and that issued from all the Mints of the United States, made from gold mined on the Pacific slope, has amounted to upwards of seven hundred millions of dollars—seven-eighths of all the gold coined in the United States since the declaration of independence. And of all the silver coined in the United States since 1841, equalling in value $16,210,585.32, the Pacific States and Territories have supplied one-half nearly, of which $6,974,925 have been issued from the Branch Mint in this city. Of all the gold coined in this city the largest quantity was issued in the shape of money in 1856, when $29,209,218.24 was coined, this being nearly three times the value of the amount first coined here in 1854, which was $10,842,281.23. This latter doubled the following year, and, as we have seen, nearly trebled the second year after; but it has never attained anything like these dimensions since, save last year, when it exceeded $25,000,000 in value. During all the other years it has wavered in value between about fourteen and nineteen millions of dollars. The greatest quantity of silver coined here was in 1868, when $822,000 worth was converted into money. And the extent to which gold of California production enters into that minted in the Union is shown conclusively by the fact that out of all the gold coined in the United States Mint at Philadelphi, amounting in value to over two hundred and fifty-seven million dollars, not less than two hundred and thirty-one million dollars worth was minted from California. It is

An Interesting Question,

That which aims to know what has become of all the bullion, etc., hence exported. More than six hundred million dollars worth has been sent to New York since 1848, and considerably less than half of that has been coined. Even allowing for a very large surplus for use in the arts, etc., a great portion of the balance is unaccounted for. It is shipped to England—one of the great store-houses of the wealth of the nations—shipped, too, as well as hundreds of millions of dollars worth of coined gold made mainly from California gold, sent across the Atlantic to pay for the innumerable articles of luxury and necessity needed by the population of the Union, so largely increased in numbers and wealth. In fact, by much the greater part of all the bullion that we export ultimately finds its way to England, so that in reality it is for England, her wants and necessities, and later for France and Germany, which absorb California gold through England, that we have been piercing into the bowels of the earth for more than a quarter of a century. The use of it made in this city in the

Arts and Manufactures

Are, considering our population, great, not less than 16,000 ounces of gold, and 67,000 ounces of silver being used every year by our gold and silver smiths. Riches and leisure have brought refined tastes, and our wealthy merchants and professional men fully employ the time and test the artistic skill of our workers in the precious metals. And finer specimens of jewelry, gold and silver ware cannot be found in any part of the world than are found in our city. The beauty in particular of our silver ware, the chasteness and elegance of the designs, and the labor and skill that must be expended in their elaboration, are truly subjects for wonder. The value of these various articles, some sets of which are themselves worth more than $1,000, is every year equal in round numbers to $500,000, and notwithstanding that the golden days of the olden time have in a great measure passed away, our manufactures of gold and silver wars are increasing in extent and importance year by year.

We have Made the World Rich

By the immensity of treasure which we have poured into the circulating channels of trade and commerce. It is estimated that the amount of gold and silver coin necessary to conduct the commerce of Great Britain is equal to not less than $410,000,000. But we have sent three times that amount abroad into the world since the opening of our mines, at least one-half of which has found its way directly or indirectly to Great Britain. The amount of gold and silver coin in the world has probably a value in the neighborhood of $2,000,000,000. More than $700,000,000 of this coined in the United States have been added to the general circulation since our mines began in 1847, and there is no doubt that one-half of it, and more, has been coined from California and Australian gold, and Nevada silver, since 1847. The wonder of all who have thought about the subject has been, that the price of gold has not depreciated in consequence of the immense additional supplies thrown on the markets of the world, or, which is the same thing, that

Prices Generally have not Risen.

This, however, is a mistake, for prices have risen. It is of course, assumed that the advance in prices which has taken place all over the world during the last thirty years is the effect of increased demand and an increased rate of wages. If, however, there is an increased demand the facilities for supplying the demand have increased in an equal or greater ratio, and the increase of wages is only a legitimate consequence of the advance in prices. The latter have undoubtedly advanced, and in some instances enormously, and the cause is no doubt due to the immense quantity of the precious metals poured into the markets of the world, depreciating their value and enhancing the value of everything that they purchase. This depreciation of gold and silver, however, has not been at all in proportion to that which might have been expected; but this is quite easily accounted for,

The Wants of Commerce and the Increase of Population

Have caused a demand out of all proportion to that of former days. The immense multiplication of man's powers by the many mechanical inventions that have been made of late years have of course also thus raised the value of the aggregate industrial wealth, and thus required an enlarged supply of the circulating medium. In fact, but for the vast development of the credit system, and but for the use of greenbacks in the United States, there can be no doubt that gold and silver would have increased very much in value, and that prices generally would have very perceptibly declined. The increase of population also has a tendency to bring about this result. The population of Europe increases at the rate of about one per cent. per annum; that is, it about doubles every fifty years, and of course without any disturbing causes intervening, the demand for gold and silver would increase with the increase in population. But in fifty years, unless a paper currency is largely substituted all over the world, it is certain there will be needed four times as much coin as now, and that of course unless this need is supplied prices must fall enormously.

The Future

Of this coast, as a bullion-producing region, will, we believe, be as distinguished as the past. We have as yet only begun to discover the wealth that is hidden in the recesses of that mighty mountain range which, beginning at the Straits of Magellan, terminates only with the Arctic Ocean. Improved methods of mining and extraction will develop in the mining regions in California and Nevada and the Territory of Utah, and unfold a wealth which the present generation never dreamed of.—*Chronicle.*

Tuolumne's Gold.

Could the figures be correctly given as to the amount of treasure Tuolumne has poured forth from out her rugged bosom, and sent out to enrich the world, it would astonish the most extravagant in calculation. Even a rough estimate—for such could only be given were it attempted—would be sufficient to open the eyes in wonderment of those living at a distance and not acquainted with her resources. The amount shipped by buyers of gold-dust in the various towns and camps since the days of '49 to the present time, has been counted by millions—that carried away by private hands of various nationalities, in specimens and dust, cannot be even guessed at. Mr. Kenfield, of Wells, Fargo & Co., Sonora, says that he has shipped since his connection with the firm as agent in this town—a period of nearly sixteen years,—at least *seventy-five tons of gold*, or as much as eight of our largest freight teams could comfortably haul—which would amount to, at least, thirty millions of dollars. We do not wish to be understood the entire amount to be gold-dust—but a large part of the shipment, at least two-thirds, has been the product of our mines and resources in and around Sonora. Who can compute the untold wealth that has never been brought to light, and of which we pass over in our daily walks and ramblings? The bulk of her treasure lies buried in her soil, awaiting capital and perseverance to bring it forth.—*Sonora Independent.*

Plumbago. — An exchange, republishes an article from the Kansas City *Journal of Commerce*, which announces the discovery of a plumbago vein in Kansas, and asserts that it is the first plumbago discovered in the West. Now Tuolumne County in this State is pretty far West, and plumbago in large quantities has been known to exist there for several years; in fact the veins have been worked to a considerable extent, furnishing sufficient to supply the demand for foundry facings to the foundries in the State; not a small amount by any means. Lately J. W. Rover of this city, discovered a plumbago vein near Columbia, samples of which have been tested here and in the East, and it has been pronounced the best article yet found in the United States. Mr. Rover is now engaged in developing the vein which increases in size and quality as it is prospected.—*San Joaquin Republican.*

The Comstock Lode.

Upon paying a visit to San Francisco, says the Virginia *Chronicle*, nothing so completely surprised the denizen of Washoe as the manifest feeling of distrust and uncertainty in the minds of stock operators in relation to the future prosperity and development of the Comstock lode. Here everybody is hopeful. No matter how much the Bulls and Bears may hollow and growl at the Bay, the citizens of Storey county and the mineral bearing regions round about keep on the even tenor of their ways, fully assured that our great mines were never before half so promising in prospective development and ultimate richness. For many weary years our mine owners and laborers had to contend against almost insurmountable physical obstacles in order to get a start in practical and profitable mining. At first, the machinery was crude and ill adapted to the purposes of ore reduction. The roads over the Sierras were at times almost impassable. Amalgamators and superintendents in many instances were inexperienced persons, incapable of managing their several departments. Worse than all, our people were for years constantly vexed and grievously imposed upon by unscrupulous and pretentious charlatans who claimed to be scientists and mining experts. This gang of unconscionable fellows not only led the miners astray in their endeavors to seek the true mineral deposits, thereby causing many years of useless labor and great waste of precious time, but unmercifully fleeced San Francisco and Virginia out of vast sums of ready cash. It is pleasant to know that these perplexing hindrances to our prosperity have all been removed. We have now a railroad running from San Francisco to our very dump piles. Our mills are supplied with machinery such as experience and mechanical ingenuity suggested as being requisite for speedy and profitable work. Hard work, persistent pluck and common sense have at last shown the true position of the rich ore deposits, and the occupation of the scientific (?) quack is gone. The vast expansiveness of many of our deep mines augurs well for the future of the whole great mineral belt—in fact, it may be fairly asserted that all of the work which has been done on the Comstock during the past decade was merely prospecting the mine. The incomparable richness of the original croppings, which at one period everybody supposed would "peter out," still manifests its golden presence at hundreds of feet from the surface, and the great argentiferous ledge has widened from a mere trace of broken quartz to a bed of glittering treasure many yards in breadth, apparently inexhaustible and unfathomable. For a time it was feared by mining men that the increasing heat at great depths would ultimately render work impossible, but at present, by judicious and skillful ventilating appliances, the work goes steadily on, and by the time this mode of ventilation becomes impracticable, the Sutro Tunnel will be ready to breathe through cross sections in every portion of the mines. As stated above, for a long period one of the principal obstacles in the way of development of the Comstock, was the perplexing uncertainty as to the true position and dip of the great ledge. For years many believed that the vein dipped westwardly in the foot of Mount Davidson, and the result of this mistake was the wasteful expenditure of many millions of dollars in drifting through the barren, hard rocks of that obdurate old mountain.

At length, by dint of hard knocks and perseverance, miners discovered the inestimable fact that the main ledge of the Comstock dips towards the east with an average inclination of from 40 to 50 degrees; that it is a true fissure vein of unknown extent running through the earth in direction nearly north and south. The result of this discovery was the removal of several of our principal hoisting works many hundreds of feet eastwardly, and it is now considered only a question of time when the rest will have to follow suit.

New Project.—Engineer Patten, of this city, has a project in view, which, if fully carried out will be the best thing that has happened to this section of country since the first discovery of gold. It is well known that the whole section of country about Smiths Flat, Prospect Flat and White Rock, is composed chiefly, of gold bearing gravel, much of which will not pay to work with present appliances. The project of Mr. Patten is feasible and simple, it seems to us, and must strike any one so who is at all familiar with the country, upon examination of drawings which he has made; it is simply to build a tunnel from the bed rock at Smiths Flat directly south to Usher Creek, takes it under Prospect Flat, of sufficient size and with adequate fall to carry off all the water and debris of the various mines, and deposit the same in Usher Creek. With the aid of such a tunnel—with branches—and a sufficient supply of water, all the gravel in the whole region could be worked for one-half what it now costs, and perhaps for much less. The distance of the proposed main tunnel is 3,000 feet, and Mr. Patten estimates that it can be contracted for $30,000. A small sum, surely, for the great advantage obtained by it. It would seem that there would be no trouble in procuring capital to take hold of such an enterprise, for it would certainly be a big investment, and he permanent for at least fifty years. Should this project be carried out, it will do more toward hastening *the* ditch than anything else we know of.—*Placerville Republican.*

MECHANICAL PROGRESS.

Proposed Novelty in Fireproof Buildings.

The *Scientific American* recently suggested that some plan should be devised for constructing iron buildings with hollow walls and so connected that in case of fire the walls might be instantly filled with water from the hydrants, thereby making them perfectly fireproof. The presence of the water would prevent any undue heating or warping of the iron, the same as is accomplished in the case of the steam boiler. The problem was to construct a building that would be absolutely fireproof.

The *Manufacturer and Builder*, since the Boston fire, has had an interview with an ingenious mechanic who has been at work upon this problem ever since the Chicago fire, and who has finally perfected a plan for which a patent is now pending, and which consists of two light iron plate walls, either rolled or cast, and formed with columns of a double T T or I letter I, or any other practicable shape, rabbeted on the edges, and made water-tight by caulking and by fire and water proof cement. The sills, joists and plates are constructed in the same manner, the hollow chambers, formed by the iron plates and column, communicating with each other, and the building held together firmly by horizontal and perpendicular concealed nutted rods. The building can be ornamented in any style to suit the taste of the owner. The novelty of the idea consists in connecting the chambers thus formed, through the sills, with the water mains of the city. When in danger of fire the water is turned on, and the pressure at once forces it into these chambers from sills to plates, and throws it in jets, from different places, upon the roof, completely flooding it, and rendering the building absolutely fireproof, even in the most intense heat.

A building constructed on this plan would require little or no insurance, would save much valuable ground that is now used for thick walls, and can be made at the mills, the parts adjusted and numbered, and shipped and put up with the same facility that bridges are now.

The cost of such a fireproof building will not exceed that of a granite, brick or iron one of a similar style of finish. The paper above quoted says that a company is to be formed for the manufacture and erection of buildings on this plan.

Tensile Strength of American and English Iron and Steel.

A series of experiments was recently made at the Camden and Amboy Railroad shops, Hoboken, N. J., by Mr. F. B. Stevens, in presence of a number of well known engineers and Prof. Thurston and his pupils, from the Stevens Institute of Technology.

The samples tested were from lots sent into market by various manufactnrers, and may be considered to represent, in most cases, an average quality of the several grades.

Thirty-three experiments were made upon iron taken from the exploded steam boiler on the ferry boat "Westfield." The following are the results:

Average breaking weight, lbs. per sq. in	41,653
Highest " " "	50,182
Lowest " " "	29,082
Latter less than former, *per centum*	42

Sixteen experiments were made upon high grade American boiler plate (Sligo), and resulted as follows:

Average breaking weight, lbs. per sq. in	54,123
Highest " " "	57,012
Lowest " " "	51,813
Variation in *per centum* of highest	9·1

Fifteen experiments were made upon best grades of American flange irons:

Average breaking weight, lbs. per sq. in	42,144
Highest " " "	53,277
Lowest " " "	(?) 33,003
Variation in *per centum* of highest	(?) 38

Six experiments were made upon English Bessemer steel:

Average breaking weight, lbs. per sq. in	83,621
Highest " " "	86,580
Lowest " " "	74,509
Variations in *per centum* of highest	14

Five experiments were made upon the best English boiler plate (Lowmoor):

Average breaking weight, lbs. per sq. in	58,984
Highest " " "	64,000
Lowest " " "	55,300
Variations *per centum* of highest	14

Two experiments on iron taken from the exploded steam boiler of the "Red Jacket," resulted thus:

Average breaking weight, lbs. per sq. in	49.000
Highest " " "	56,000
Lowest " " "	42,000
Variations in *per centum* of highest	25

The testing machine used was constructed by Messrs. Richle Bros., of Philadelphia.

Referring to previous tests of iron from the Westfield's boiler it will be noticed that these experiments reveal a greater variation in strength than was there found, while exhibiting about the same average strength, and thus tend to confirm the conjecture expressed by Prof. Thurston in connection with the report of the first series of tests: that a weakening effect may be produced by the wrenching and twisting accompanying explosions. Mr. F. B. Stevens, and other engineers of experience, express the same opinion.—*Journal Franklin Institute.*

BARRON'S STEEL PROCESS—SEVERE TESTS.—Barron's process for the manufacture of steel tools—or rather for the conversion of iron tools into steel—is now in successful operation in Lonisville, Ky., where it has attracted much attention, and has met with very encouraging success. Tools which are to be prepared by this process are first made of cast iron, after which they are introduced into a revolving drum, where the roughness and adhering sand from the moulds are worn off by attrition. The smooth irons are then packed in layers in iron boxes, where they are closely imbedded in clay, and subjected to the action of oxide of iron and certain chemicals, by which the iron is decarburized. There seems to be a secret connected with this part of the process. In these boxes the iron tools are subjected to annealing heat, which is maintained for from three to six days. They are subsequently put in a retort capable of containing about a ton of the tools, into which the vapor of gasoline and other carbonaceous materials are passed. In a few minutes the iron is transformed into steel, when they are ready to be tempered, and ground and polished for the market. The explanations of this process which we have seen are not as clear as they might be, but of the quality of the steel thus produced there is very little question. Professor J. S. Newberry, of the School of Mines, Columbia College, New York, referring to this subject, says: "With tailor's shears cast in shape, made malleable, and then converted by the Barron process, I have cut Florence silk so nicely as to prove the edge perfect; then, with the same shears, have cut up sheets of tin and untempered steel; returning to the silk have found the edge wholly unimpaired, and this after a repetition of more than twenty times." By whatever process steel of this description is made, its exceeding value must create for it a wide demand, and soon render the method by which it is made widely celebrated. —*American Exchange and Review.*

COHESION OF MANUFACTURED IRON.—The Ironton *Register* gives the following statistics regarding the tensile strength of manufactured irons:

The tensile strain of bar iron is given variously from 40,000 to 90,000 lbs. to the square inch. The latter is a very exceptional figure. The main tensile strain of American bar is reported by Professor Johnson at 55,900 lbs., while English bar holds at 53,900. Hewitt's Report of the Paris Exposition chronicles a list of tests with Swedish bar, which ranged from 40,000 to 45,000. Franklinite iron, which runs up sometimes to 70,000 lbs. to the square inch. The Lehigh and Scranton irons hold at from 47,000 to 53,000, but the Juniata, noted for its chains and boiler plate, stands the test at 65,000 to 69,000. In the Pittsburgh irons, the tensile strength ranges from 50,000 to 53,000. The Mahoning Valley, St. Louis, Indiana, Michigan, and other irons, stand at 50,000 to 55,000—very few going down to the first figures

IMPROVED CONSTRUCTION OF TOOLS FOR TURNING METALS AT INCREASED SPEED.—This tool has one or more holes drilled through it up to its cutting edge, through which a jet of water is delivered underneath the shaving that is being cut, and upon the cutting edge of the tool, for keeping it cool in working. By this means the tool is much more effectually cooled than by the ordinary water jet dropping upon the upper surface of the shaving, in which case little or no water reaches the point of the tool itself. The result of cooling the tool by delivering the water jet direct upon the cutting edge is that the surface speed of the tool can be increased four times in heavy cuts, and light cuts can be taken at as much as eight times the speed that is usually practicable with ordinary tools, without any risk of the temper of the cutting edge being destroyed by over-heating.

STEEL RAILS.—At the recent half yearly meeting of the Grand Trunk Railroad company, in London, the President said that 3,500 to 4,000 rails on the line break every winter! But he found comfort in the fact that, in about 110 miles of steel track, only eight or ten rails have been broken. It was feared when Bessemer rails were first introduced that their resistance to wear would be counterbalanced by unusual liability to break, and that they would be especially dangerous in severe climates, the impression being apparently that, having something of the hardness of cast iron, they had also something of its brittleness. This experience of the Grand Trunk Railway, however, indicates that they are especially fitted for such climates.

OUR IRON YIELD.—The yield of the 50 furnaces now erecting will add 500,000 tons of pig iron to the present annual production of the United States, and it is estimated that the productive capacity of all our furnaces will be 3,000,000 tons per annum within two years.

CAR AXLE PATENTS.—It is stated that 104 patents have been granted in this country upon car axles and wheels having the idea in view, of making car wheels to run independently as in turning a curve.

THE STEAM WHISTLE.—Was invented about the year 1835, and was at first applied as a low-water detector.

SCIENTIFIC PROGRESS.

Extraordinary Meteoric Display—What has Become of Biela's Comet?

On Sunday evening, Nov. 24th, a remarkable meteoric display was witnessed from the Observatory at Washington, also at New Haven, Conn. It appears that between 7¼ and 12¼ o'clock, upwards of 250 shooting stars were seen radiating from a point near Gamma Andromeda—the precise point at which astronomers were then looking for the expected return of Biela's comet.

In 1846 that body was seen to divide into two comets, slowly increasing their distance from each other as they move off into space. At their next return in 1852, they were a million and a quarter miles apart. Since that time neither portion of the comet has been seen, though their third passage of the node should have taken place about six weeks ago. Astronomers have for some years been suspecting that the comet had entirely gone to pieces, and that it would not again be seen. Sunday evening were seen, as above stated, about 250 fragments of the comet. A large number of observers would probably have been able to count 700 or 800 in the time named. The process of breaking up has evidently been going on a long time. Mr. Herrick saw in 1838, December 6, quite a number of fragments, though he did not then suspect that they had any connection with this or any other comet.

Both B. F. Sands, Superintendent of the Washington Observatory, and Prof. H. A. Newton, Astronomer at Yale College, believe that these meteorites are veritable fragments of Biela's comet, and have no connection whatever, with the ordinary November meteors or any other meteoric display which heretofore have been observed.

The Molecular Phenomena of Evaporation.

"Why is not all the water in a steam boiler converted into steam at once? Might it not be possible for such an event to occur under certain circumstances?" The *Scientific American* answers the above question as follows: The labors of scientific men, in the field of experimental investigation, have shown, that heat and mechanical energy can both be measured by similar effects, can be converted, the one into the other, and that they have definite and well known quantitative relations to each other. One pound of water requires an amount of heat to be communicated to it, for each degree Fahrenheit that its temperature is raised, which is equivalent in energy to the mechanical action required to raise 772 pounds one foot high. In other words, as usually expressed, a thermal unit has a mechanical equivalent of 772 foot pounds. The combustion of a pound of coal liberates an amount of heat which, although variable, may be taken, with good fuel, as equal to about 13,000 thermal units.

The evaporation of a pound of water from, say 60° Fahrenheit and at 75 pounds pressure, requires the expenditure of 260 units of heat to raise it to the temperature of 320° Fahrenheit, which is its boiling point; and then, before it can be compelled to expand into steam, of 75 pounds pressure, an amount of work must be done which demands the expenditure of 891 additional thermal units, equivalent to the enormous quantity in mechanical work of 697,852 foot pounds, enough to raise over three tuns to the hight of 100 feet. We then have a pound of steam at a pressure, as indicated by the steam gage, of 75 pounds per square inch and occupying a volume measuring a trifle over five cubic feet. The evaporation of steam of 150 pounds pressure would require about one per centum more heat than has just been estimated, and a pound of it would occupy about three cubic feet. A moment's calculation will show that a pound of our fuel is capable of developing heat enough to evaporate about 11 pounds of water from 60° Fahrenheit, but, in practice, a considerable proportion is invariably wasted, and an evaporation of 8 pounds into dry steam is an unusually good result.

If, then, a pound of fuel is burned under an ordinary steam boiler, not more than about 8 pounds of water can be vaporized, for the simple reason that the fuel only supplies just heat enough to evaporate that amount; and if the fuel occupies one minute in combustion, the boiler can only deliver eight pounds of steam per minute. If the supply of heat is cut off, the evaporation of the water ceases at once; if the heat is supplied rapidly, steam is made rapidly, and is always at a rate precisely proportioned to the rate at which heat is applied. We can conceive of no circumstances under which the fuel can supply sufficent heat to evaporate all the water in a steam boiler in any very short space of time."

The Future of Science.

The following extract is from Sir Charles Lyell's recently published volume on the "Principles of Geology: We are sometimes tempted to ask whether the time will ever arrive when science shall have obtained such an ascendency in the education of the millions that it will be possible to welcome new truths instead of always looking upon them with fear and disquiet, and to hail every important victory gained over error, instead of resisting the new discovery long after the evidence in its favor is conclusive. The motion of our planet around the sun, the shape of the earth, the existence of the antipodes, the vast antiquity of the globe, the distinct assemblages of species of animals and plants by which it was successively inhabited, and, lastly, the antiquity and barbarism of primeval man—all these generalizations, when first announced, have been a source of anxiety and unhappiness.

The future now opening before us begins already to reveal new doctrines, if possible, more than ever out of harmony with cherished associations of thought. It is therefore desirable that, when we contrast ourselves with the rude and superstitious savages who preceded us, to remember, as cultivators of science, that the comparatively high places which we have reached in the scale of being have been gained, step by step, by a conscientious study of natural phenomena, and by fearlessly teaching the doctrines to which they point. It is by faithfully weighing evidence without regard to preconceived notions, by earnestly and patiently searching for what is true—not what we wish to be true, that we have attained that dignity which we may in vain hope to claim, through the rank of an ideal parentage.

ATMOSPHERIC PHENOMENA OF THE BOSTON FIRE.—The Signal Service Observer, at Boston, gives the following interesting facts connected with the late disastrous fire of Boston:

The induced currents of wind to take the place of the heated air rising from the fire flowed inward toward it through adjoining streets with great velocity, so much surpassing on the lee side that of the prevailing wind that the fire itself was driven to windward. He reckons the velocity of this indraught on the lee side at 30 to 35 miles per hour, making the fire somewhat like that of a blast furnace. The heated air, gases, smoke, and steam in rising took, as might have anticipated, a spiral movement. A reversed parallel to this tendency of fluids under the influence of gravity to assume the spiral motion when the central portion is withdrawing and the deficit is supplied from the sides, is seen when the plug at the bottom of a basin of water is removed and the basin is kept full from near its edge. An accomplished German mathematician has reconstructed the entire nebular hypothesis on this principle of the tendency of gravitating fluids to form spiral vortices. It was asserted that at the great fire of San Francisco a building was seen to leave its foundations, bending over and falling into the flames as if drawn in by suction. With such facts as the present before us, that statement seems less improbable. The circumstance that the Boston observer's thermometer rose five degrees at a distance of 2000 feet from the fire and directly to windward, gives some notion of the intensity of the heat. One of the dispatches from this fire mentioned a circumstance similar to what was averred to have frequently occurred at Chicago—that flames broke out ahead of the fire in buildings it had not yet reached.

NEW METEOROLOGICAL THEORY.—Mr. F. Capen, according to the Harrisburg (Pa.) *Mercury*, who is a member of the American Meteorological Society, and who has devoted many years to studying the weather, believes he has found the key to the whole meteorological system of the globe. He is now in Hartford, and the *Times* of that city tells us that so confident is he of the verification already obtained of the principles which he has finally adopted, that he has accepted from General Myers, Chief of the Signal Bureau at Washington, a proposition to submit this theory to an extraordinary test. He desires Government aid in the prosecution of his work of investigation; and to test the reality of what he believes he has already discovered, he accepts a proposition to foretell the weather seven days in advance, and he offers to continue this seven-day test for a time long enough to satisfy the Government of the truth of his principle. His claim may seem preposterous to scientific men generally, but meteorology is making rapid strides, and if the "clouds that lower on our house" may be foretold by seven hours, why not by seven days?

SENSITIVE STREAMS. — Professor Edwin J. Houston, while spending a summer's vacation in Pike County, Pennsylvania, discovered the sensitiveness of water to sound waves. Among the many beautiful waterfalls of that section, he found one scantily supplied with water, which dripped in small streams from the ends of the moss covering the rocks of the precipice —the air being still, and the stream free from ventral segments. And it was found that on sounding a shrill falsetto note the stream would instantly respond, and change the gronping of the drops and the position of the ventral segments. A heavy rain, however, flooded the stream, and prevented further investigation.

S. F. Stock and Exchange Board.

THUBSDAY, Dec. 19th, 1872.

The Stock Market this week hae manifested an agreeable upward tendency, after having been in a depressed condition for eome time past. Prices show a material advance over those of last week, and more descriptions are dealt in. This muet be very comforting to the brokere, as hut a light hnsiness hae been done for eome time past, while the tendency now indicates a still further advance.

The election of the Trustees of the Empire Mill and Mining Co., the resnlt of whioh will be found in another column, ie of intereet eince an entirely new Board was appointed. Thie is said to he the successful result of a combination, formed by R. N. Graves, Seth Cook, Flood & O'Brien and Archibald Boland, to wrest the control of the mine from the Union Mill and Mining Company. It ia also said that the Gould & Curry has chauged hands, and that Flood & O'Brien will have the management of it, with Robert Gravee as Superintendent. This takes two of the leading mines in Waehoe out of the hands of the old managers. As the Empire Mill mine is considered the key of Gold Hill the prohable future policy of the new Board is of eome interest.

The St. Patrick G.M. Co. have called a meeting on the 21st of Janusry to take into consideration a proposition to increase the capital etock from $500,000 to $2,000,000 in 20,000 shares.

The Kentuck Company will meet Jan. 2d, to eee ahout increasing their capital etock from $400,000 to $3,000,000 in 30,000 shares.

The Gould & Cnrry meeting to he held next Monday ie to concider a proposition to increaee the stock from $2,400,000 to $9,600,000 in 96,000 ehares.

On Friday the market was much bstter and stronger with a freer demand, than on the day previous. Belcher was $2 higher; Crown Point $2; Cons. Virginia, $1; Caledonia, $3; Hale & Norcroes, $2; Ophir, $3; Imperial 50 cents; Jacket, $4; Savage, $1; Hermes, $2; Raymond & Ely declined $4.

Saturday the market etill gained strength and sales were numerous at good prices. Belcher rose $1; Crown Point, $2; Cons. Virginia, $2; Chollar, $3; Confidence, $1; Imperial, $1; Empire Mill, $1; Hale & Norcross, $2; Ophir, $4; Overman, $4. Raymond & Ely was $8 lower.

On Monday Washoe stocks in particular took a rise and pricee were better than on previoue day.

Tuesday the market was steady and active. Belcher rose $1; Crown Point $4; Chollar, $1; Gould & Curry, $10; Ophir, $4; Overman, $5; Savage, $10; Jacket, $4; Raymond & Ely $1.

On Wednesday, pricee showed a still further improvement in the morning hut at the afternoon Board, quotations evinced a decline. Belcher was $2 lower; Crown Point, $3; Chollar, $6; Cons. Virginia, $4; Hale & Norcross, $6; Gonld & Curry, $6; Overman, $8; Savage, $11; Jacket, $3.

To-day the market was not very active and prices fell off a little from those of previous day.

Below will be found news from the prominent minee later than that in onr "Miniug Summary."

RAYMOND & ELY.—On the 12th $32,564 was shipped hy the Superintendent; on the 15th, $32,532 to latter of which add previous ehipments for the month $124,283, which makee a total of $156,831.85 equal to $10,455.40 per day.

SAVAGE.—For week ending Dec. 14th, 1,154 tons of ore were taken out, assaying $30.69 per ton; 1,049 tone were sent to mill.

BELCHER.—About 340 tons of ore are being extracted per day.

EUREKA.—The last weekly clean np was 1,409 onnces of amalgam from 6 day's rnn.

PHŒNIX.—On the 10th, ten tons of bullion wae shipped, asssying in gold and silver $338.90 per ton.

CHIEF OF THE HILL.—On the 16th $3,680 wae received from this mine. Total receipts for Novemher were $13,463.59.

PIOCHE PHŒNIX.—A letter of the 16th says that the ore will run from $300 to $400, and will require no sorting; the ledge is fully 6 feet wide.

CALIFORNIA NAVY CLOTH.—The Navy Department a few days ago awarded to a California woolen mills company the contract for 6,000 blue cloth pantaloons and 50,000 yards of blue flannel for navy use, a very gratifying occurrence, which is rendered decidedly remarkable by the facte that the goods mentioned are required to he delivered in New York city without charge for traneportation, and that the contract was obtained againet numerous Eastern competitors of the highest standing and largest facilities.

——* Advertised in this journal.

SOUTH AMERICAN MINES.—An *Alta* correspondent writing from Lima gives the following item in relation to the minee: The Mejillonee Mining District is proving to he rich beyond all expectation, and the fabulous amount of silver which has been and ie heing discovered there hae euddenly rendered the locality of great importance. The yield of ore and the richness thereof are heyond all expectation, and the mines are heing worked in the face of the moet terrible difficulties, want of water heing the most serious. As moet of the mines helong to Chilenos, aud by far the larger proportion of the workmen are likewiee from Chili, while the government (snch as it is) ie Bolivian, you can readily imagine what a prolific field there is for trouble, and how little likely it is that peace can reign while both countriee claim the territory.

LAKE SUPERIOR MINES.—The Marqnette *Mining Journal* says that there are qnite a nnmber of important new mining movements on foot some of which involve sales amounting to several hundred thousands of dollars, but none of them are far enough advanced to admit of announcement. They all cotemplate the uee of Eastern capital for the immediate development of mining resources.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

CALAVERAS COUNTY.

NEW MINE.—Calaveras *Chronicle*, Dec. 12: Mr. Englehright ie prospecting some quartz on the Mokelumne Hill road, which promisee to he valuahle. The vein ie 3 ft. wide, and abounde in sulphurets.

WEST POINT DIST.—Calaverss *Chronicle*, Dec. 14: The Blazing Star is turuing out very handsome ore, and recent explorations have determined that an extensive body of valuable ore exists south of the main shaft, below water level. The Seminole Co. are repairing their over-ehot water wheel, and the mine will be cleared of water eoon. Explorations in the Lone Star have developed an unlimited supply of fair milling ore.

BLUE MOUNTAIN DIST.—The Heckendorn cleaned up a run of 48 houre and to judge from the bulk of the amalgam, the ore must he yielding very handeomely.

A RICH DISCOVERY.—Calaverae *Citizen*, Dec. 14: Laet week John Andereon discovered a em

MONTEREY COUNTY.

Quicksilver. — Castroville *Argus*, Dec. 7: 60,000 lbs. of quicksilver were shipped from the New Idria Mines to Hollister, during Nov.

PLACER COUNTY.

Green Mine.—Placer *Argus*, Dec. 12: The ledge will average two ft. in width throughout. They are running the mill on a fair average of the ore, which is a high grade. The Co. are preparing to sink the shaft to the depth of 300 ft.

PLUMAS COUNTY.

Struck It.—Quincy *National*, Dec. 7: Bidwell & Co. have completed their tunnel in the Greenville, and find the ledge richer than ever.

Betterton.—Mr. Betterton has recently resumed operations, and the ledge looks splendidly.

PLUMAS COUNTY.

Maxwell & Co.—This Co. have commenced operations on an enterprise, which bids fair to be very profitable. The Co. have claimed the water of Spanish Creek, and their ditch leaves the river at the falls, about a mile above the mouth of Blackhawk. The ditch is of a capacity of about 4,000 inches. The first point which the Co. intend to work, is known as Brown's point. Good prospects have been obtained at this place, and it is thought that a large amount of paying ground will be worked here. The ditch will be extended down the river as fast as possible, as it is known that several high bars under the line of their survey will pay well for working.

SISKIYOU COUNTY.

Hombco.—Yreka, *Union*: Bender has bought out Rabbit's interest, and Pugh the interest of Neill in Lawson Gulch.

Parker, and others of Little Humbug intend to open and prospect claims on the Klamath.

Foug & Co., are erecting a hydraulic.

The Klamath river and bars are claimed for 15 miles, counting each side of Delaney's recent rich strike.

The Eliza Co. is running a tunnel for the purpose of obtaining a further supply of water.

Nevada.

ELY DISTRICT.

Bullion.—Pioche *Record* Dec. 8: The shipment for the week amounts to $73,560.58.

Silver Peak.—The ledge improves as sinking progresses. The Supt. leaves for S. F. tomorrow to make arrangements for getting hoisting works for the Silver Peak and stamps for the Condor mill. The shaft is 150 ft. in depth and 150 tons of rich ore has been placed on dump. Eight men are constantly at work sinking an incline, and Friday afternoon a ledge over 6 ft. in width presented itself. Ore was placed in the forge and large globules of silver came to the surface. The rock is very rich.

Pacific Tunnel.—The work is being pushed rapidly. The shaft in the first ledge is down about 40 ft., and the ledge is looking very well. The whole work employs about 18 men.

Jolly Traveler.—The shaft has now gained a depth of 120 ft., different strata of ore have shown themselves throughout the mine while sinking. It is proposed to sink to the depth of 200 ft. and drift to the ledge.

Pioche Phenix.—New shaft down 160 ft. and well timbered. Hoisting work will be completed in 6 days after all the machinery arrives. The ore in the old works have improved very much the past week. The ledge is 5 ft. wide, the greater portion of which will average $250 per ton. Hoisting 8 tons per day.

Prairie Queen.—Showing a ledge at the top 3 ft. wide, and following almost to its depth, now 50 ft.

Mazeppa.—The mine is down 180 ft. It is proposed to make the first station at the above depth. Raising of ore will be commenced soon.

Mahon.—Indications in the shaft are more encouraging than they were a week ago. The ledge shows improvement.

Amador Tunnel.—The tunnel has been driven in 375 ft. and 60 tons of ore are on dump. Drifting is constantly going ahead. The ore being raised comes from the winze 80 ft. below the tunnel. A fine ledge has been developed and it is the intention to drift on the ledge and raise the ore to the surface.

Grey and Bishop.—Two hundred ft. has been sunk, some fine ore has shown itself and the prospects are decidedly flattering. Three shifts are kept constantly at work—12 men in all.

Newark.—Work in all portions of this mine is being pushed ahead.

Sunbeam is 210 ft. in depth; the Supt. proposes to make this depth the first station. Ore has been shipped lately to the Magnet mill at the rate of 8 tons per day. The last bar returned, proved itself to be $166.46 gold and $1,904.48 silver, making a total of $2,071.24.

Ocean Bell.—The owners have concluded to start the work again. They have sunk a shaft 160 ft. Sinking will continue until 200 ft. is reached, when drifting will be commenced.

Excelsior.—Shaft has reached 175 ft. The ore is entirely free and the east winze brings forth the best ore; 10 tons are being raised per day.

Chief East Ex.—Drifting east on the 90-ft. level. The ledge has improved very materially during the past week.

Caroline.—Shaft down 100 ft. and commence timbering to-day. A contract has been let to sink and timber 50 ft. more. At the bottom seams of quartz appear. From the pitch of the ledge in the old works they expect to strike it in the new shift by the time 50 ft. is sunk.

Chapman.—Twenty tons of first-class ore is being raised daily and shipped to the American Flag mill for reduction. The mill will commence crushing about the 15th, when upwards of 300 tons will be at the mill. Arrangements have been completed for the erection of hoisting works.

Chief of the Hill.—During Sept. there was shipped $10,102.84; Oct., $11,337.94: Nov., $13,462.40, making a total of $34,903.18.

Montana.—The contractors have reached a depth of 72 ft. Ore in small quantities has been opened up and a few days more will show a fully defined ledge of rich ore.

Pioche Champion.—The Supt. has succeeded in getting it to the depth of 185 ft. He is working 3 shifts and keeps constantly sinking.

Empire.—The Empire, Ophir Hill, is looking well. We mentioned some months ago a big strike into rich ore. The Empire has a strong ledge in the 8th level, and the rock is good for $20 a ton.

Rich Strike in the Pioche Phœnix.—Yesterday a very important strike was made in the Pioche Phœnix mine. It was struck in a vein running parallel to the Lightner shaft. Assays were made yesterday of the ore taken from this new strike, and it showed a yield of $3,500 to the ton.

HUMBOLDT.

Relief Dist.—Unionville *Silver State*, Dec. 7: The Batavia & Pacific Co.'s mill is running steadily. Last week the Co. shipped 112 lbs. of bullion, valued at $1,800, the result of one week's run with 5 stamps.

Dun Glen.—The Empire is worked through a tunnel which intersects the ledge 200 ft. from the surface. A drift has been run on the ledge from the point of intersection. The ledge in this drift is 2½ ft. wide. It contains rich ore, the entire ledge averaging $135 per ton.

On the Gem at the eastern end of the lower level the ledge is displaced by a cross course, and one half of the working force is engaged in drifting to find the ledge east of the fault. Two men are engaged in extracting ore, and one shift is drifting west of the old works. Three or four tons of second-class ore worth $150 per ton, and a few hundred pounds of first-class ore worth $1,200 per ton, are on dump ready for shipping.

On the Tallulah mine 4 miners are employed. Five tons of first-class ore are on dump.

Trinity.—Reese River *Reveille*, Nov. 30: The richest ledge of silver and galena ore known to exist in this country was struck in the Trinity, Galena, yesterday.

Kegs Sugar, 3,048; Bags Sugar, 1,124; Bbls. Molasses, 428; bbls Tallow, 270; bbls Beef, 33; Hides, Green and Dry, 688; Goat Skins, 4,672;

REESE RIVER.

Reveille, Dec. 7: The Monitor mill has been running steadily with satisfactory results.

El Dorado mill is going up fast.

Monitor Co.—Have run their tunnel No. 2, 500 ft., cut the vein, drifted northerly through some good ore 70 ft; have about 50 ft. farther to drift to cut the main ore chimney. Have raised from lower tunnel a chute and connected with upper works; also drifted south on lower level 20 ft., and sinking a winze. Taking out very fine ore from upper levels. Working 50 men.

Belmont Co.—The new pump keeps the water down and the lower levels are being run each way with flattering prospects. Working 30 men.

El Dorado South Con. Co.—Large quantities of ore up in the old workings of the El Dorado are ready for stoping. The new 340-ft. level, both north and south, is in good ore. In this level, a winze is being sunk in good ore, to intercept the 400 ft. level which is being pushed through to that point.

Work in the Arizona goes ahead. Some fine chloride has been found south of the Miller incline.

El Dorado North Co.—The contractors have the vertical shaft down 75 ft; progressing about 2 ft. per each shift.

Combination Co.—Lessees are taking out very rich ore from the Transylvania. Working 20 men.

Josephine Con. Co.—Capt. Stewart thinks he has a big thing in the Josephine, and he is going down with his shaft earnestly.

WASHOE.

Piotou, Gold Hill *News*, Dec. 14: Shaft 160 feet deep. The drift north from it for the ledge is in 50ft. The ledge is 7ft. or more in width, and assaying well, being silver ore, with about the same proportion of gold as that of the Belcher.

Mint.—This mine promises to be one of considerable importances before long. It is situated in the ravine below the Tunnel toll-road, and about half a mile from the Savage. The ledge is very clearly defined, about 7ft. wide, and composed of promising quartz, which assays very well. A shaft is now 57ft. deep.

Caledonian.—The body of water tapped by the south drift on the 140-foot level of the new works, is drained so as to no longer interfere with operations in the mine. The north drift on the 400-foot level is cleaned out and repaired to within a few feet of the point reached before the men were driven out by the water.

Consolidated Virginia.—The new hoisting works are about finished. The incline is down 68ft. below the 500-foot level in good sinking ground.

Hale & Norcross.—No developement of importance has been made in this mine during the past week.

Globe.—The main west drift is still driven steadily ahead, though had air at times interferes with work. The ore body in the raise is still looking finely and promises fine developments.

Chollar-Potosi.—Daily yields 130 tons of ore, the average assay value of which is $31 per ton. The ore breasts are still holding out and looking moderately fair. The new patent air compresser is in place ready to start up.

Julia.—Owing to the breakage of the machinery yesterday all work in the mine is suspended for the present.

Gould & Curry.—The main incline is down 80ft. below the 1600-foot level, making fair progress. The main east drift, at the tenth station is in 400ft. The main east drift at the eleventh station is in 120ft. with strong indications of cutting the wall of the ledge soon.

Savage.—There is no change of consequence in the daily yield or the quality of the ore extracted since our last report.

Woodville.—The works were again started up last Wednesday. The ore breasts are looking and yielding well as usual.

Belcher.—Daily yield 350 tons. Drift north from the east drift at the 850-ft. level in 323 ft. Main incline down 159 ft. below the 1,100-ft. The station for the 1,200-ft. level will be commenced soon. Winze 200 ft. south of the Crown Point line, to connect with the 1,100 and 1,200-ft. levels, down 32 ft. in fine ore. The hoisting machinery is working well

Overman.—The new machinery is so nearly completed that the work of freeing the shaft from water will be commenced in two or three days at farthest.

Crown Point.—The 1,300-ft. level opens out richer and richer the more it is worked, the cross-cut from the east winze being in over 70 ft. in fine ore, with no sign of east wall. Preparations are being made to take out ore from this level. The other parts of the mine are looking and yielding well.

Silver Hill.—On the first level the north and south drifts are being continued in the ore vein, both drifts in pay ore. The new pump is in place and the sinking of the shaft is again resumed.

Occidental.—The lower tunnel is being continued in the ore vein. The quartz through which it is passing, is of very low grade. The stream of water lately encountered in this tunnel continues to flow.

Sierra Nevada.—Daily yield from 40 to 50 tons of milling ore.

Insurance.—The shaft is all in ore of good character. The ore is looking much better than heretofore, filled with black sulphurets, and assays well.

Utah.—No work has been done in the new shaft the past week, as wood cannot be procured to run the machinery.

Imperial-Empire.— No change of material interest to note.

Baltimore Cons.—Shaft down 364 ft., making a progress of 16 ft, during the week. Drift in 138 ft., having made 20 ft. progress. Both shaft and drift still in hard blasting ground.

Senator.—This mine which was stopped for a week for want of a supply of wood was again started up to-day.

Yellow Jacket.—Nothing new to report since our last.

Knickerbocker.—Main west drift in 410 ft., with the face in hard working porphyry.

Jacob Little.—Work progressing as usual.

Arizona.

Prescott *Miner*, Nov. 30: The Vulture Co. will soon conduct water to the mine, or construct a railroad from mine to mill. They also design adding as many more stamps and other appliances to their mill as will enable them to crush and work 100 or 150 tons of raw ore every 24 hours.

P. W. Smith, who owns ground on the Vulture, has his mill almost ready for crushing.

At Weaver, the ore of the Marcus Co. is paying well.

Work will be resumed at Big Bug, and other camps near Prescott soon.

Colorado.

Boulder Co.—Operations are generally very successful and are steadily increasing in importance. The Red Cloud, Gold Hill, a gold bearing vein, produced in 4 months $100,000. The last month, its yield footed up $90,000.

Pelican, Central City *Herald* 4th: The owners have driven five levels at different elevations in upon the vein. The average width of the crevice is about 6ft. and the pay vein of the richest material goes from a foot upward. One shaft sunk from the lower level, has developed a width of crevice, during past the week, of 9ft, at a depth of 50ft. This lower level has been driven a length of 650ft. and some 1,800ft. of levels have been opened out altogether. Another tunnel is driven in at an elevation of 75ft. above the lower, and has a length of 600ft.

On the Zillah lode, there is one level opened and about 100 fathoms of ore have been stoped out.

Work will be commenced this week on another tunnel and level at a lower point on the Pelican than any of the present workings.

From May 1871 to Nov. 1st, 1872, over $580,000 has been taken out and this while the work of developing simply has been going on.

During Nov. 1872, the total receipts for ore treated and sold was $65,000.

Leavitt.—We saw a beautiful retort this morning valued at $12,000. The yield of 1,200 tons of smelting ore has been raised from the shafts during the same time and lie on dump ready for shipment.

Idaho.

Silver City *Avalanche:* Ida Ellmore.—New and extensive bodies of ore are being found in several of the old levels running ahead north. The main shaft will be down for the 9th level in a few days, and the indications are very favorable for striking a large body of ore in this level.

Golden Chariot.—The 5th and 6th levels south are rapidly improving as they pass the line of the gulch on the surface; 10 stamps of the Ellmore mill are steadily running on their ore.

Red Jacket.—Fine looking ore is being taken from the stopes above the adit-level. Drifts have been commenced in the let level, running both north and south of the main shaft, showing high grade ore in both. We were yesterday shown a large mass of ore from the deepest portion of the mine, in which free gold could be seen sticking all over it.

Mahogany.—The 6th level south drift is in 170 ft., showing good ore. The 7th level winze is down 33 ft. in fine ore. The ore bouse is full of ore.

South Chariot.—The indications are that they are coming upon a good body of ore in the 3d and 6th levels, both of which are in fair milling ore. Preparations are being made to start up the Co.'s mill on ore from this mine.

Minnesota.—The 4th level drift has cut a rich chimney of ore going north. The vein is from 20 to 24 inches in width, of ore that will pay $50 per ton. The stopes from the south winze look excellently, and yield 10 tons per day, which is being worked at the Cosmos mill. The shaft is about completed for the 5th level, and the indications are that this level will open out into a big mine.

Empire.—Is turning out a large amount of ore, on which the Owyhee Co.'s 20-stamp mill is running. The ore-house has again been enlarged. The shaft is down 60 ft. for the 4th level, and the 3d level drifts are in 50 ft. each way from the shaft.

Idaho.—We yesterday saw 2 gold bricks, at Findley and Co.'s bank, which together weighed about $16,000 worth. They were taken from the amalgamators after a run of 6 days. The 6 days of the week before gave over $12,000 or 28,000 for 12 days run.

Utah.

Beaver Lake Dist.—Utah *Mining Journal*, Dec. 12: The San Francisco has several prospect shafts sunk to the depth of from 5 to 25 ft. In the shaft there appears to be a good showing of mineral. On the several dumps of this mine there is from 25 to 30 tons of ore which will average $250 to $300 to the ton. The character of the ore is galena, chloride, carbonate, black sulphurets and hornsilver mixed.

Big Mountain Lode.—The shaft is down about 10 ft.

Fairview Mine.—Prospect shaft is down 18 ft. and shows a large deposit of mineral. Ore will assay $80 per ton.

Great Western Mine.—The prospect shaft is down about 8 ft. and the vein appears to be from 8 to 10 inches thick.

Emma.—Those who have been there say that the props in the Emma are not sufficient and that it is likely to cave in again when the ground dampens in spring. Another strike of carbonate ore has been made.

Bingham Canon.—Salt Lake *Tribune*, Dec. 7: Smelting works of the Utah Co. consist of two vertical Blast Furnaces, using steam as a motive power. The mines are 5 in number, the Belebazzar, Dartmouth, Red Warrior, Utah and Portland. The veins of ore contained run in almost unbroken parallels with each other and in each close proximity that one shaft with intersecting tunnels will be sufficient for the proper working of the mines. A new deposit of ore has been opened in the Dartmouth within a few days, which looks very promising. The furnaces are capable of producing seven tons bullion per day, and are in successful operation. The charcoal used as fuel is obtained chiefly from Truckee, California, and the iron ore for flux from Wyoming Territory. The completion of the Railroad from Sandy Station, U. S. R. R., to these works will add materially to the economy of the reduction of ores, The management is vested in J. R. Murphy, Esq., and Philip Eagle, Esq., Resident Secretary.

Ascending Porcupine Gulch bearing southwesterly to the divide between Bingham and Butterfield canons, a rolling table land is reached. Here we find the Sheridan Hill. The development consists of a shaft 150 ft. in depth and a horizontal tunnel 180 ft. in length, showing a vein of carbonate ore about 12 ft. in width. The Silver Hill a short distance south consists of a large body of ore of good quality.

Salt Lake Mines.—*Tribune*, Dec. 7: The Delaware, is opening well. The vein is about 6 ft. of quartz, averaging from $10 to $200 per ton. The Elkhorn is about 20 ft. wide, and assays from $10 to $3,000 per ton. There is also some of the best horn silver and blue sulphurets in this mine that there is in the camp.

The Utah Southern Railroad.— This important enterprise, which we have several times mentioned in these columns as ultimately designed to be extended to San Diego, is being prosecuted with a great deal of energy. Forty miles have already been finished, from Salt Lake to Leiby, and cars are now running between the two points. In addition to this, several branch roads, aggregating thirty miles in length, have been constructed, connecting the main trunk with the most important mining districts. It is believed that when 100 miles of this Utah Southern Railroad is completed, the entire trade of South-eastern Nevada will be diverted *via* Salt Lake City. The charter terminus of the road is at the head of Navigation on the Colorado river. The building of the link from that point to San Bernardino will speedily follow, and then Salt Lake will have a through-road to the Pacific at the Bay of San Diego.—*San Bernardino Guardian*

Visit to the Crown Point Mine.

Saturday afternoon, white toiling up the steep acclivity leading to the Divide. on onr return from a brief visit to Gold Hill, we were seized with a strong desire to visit one of the principal mines of the Comstock lode, never having done so before. Accordingly we retraced our steps and after working our way through a labyrinth of timhers consisting of trestle hridges, car-tracks and dumps, we eventually reached the

Unpretentious Looking Office

Of the foreman of the Crown Point mine. The office is a small sized building with a dingy appearance, not unlike that of the old Erie depot of New York City. With whatever eloquence we were master of we solicited of Mr. Kellogg, the foreman, permission to visit the mine, assuring him that we did not come as an emissary of capitalists, and that we would not carry off any rock. Mr. Kellogg kindly consented to gratify our curiosity and led us to a dressing-room where we were told to exchange our store clothes for a pair of overalls, a flannel shirt and a dilapidated felt hat. In a few minutes we emerged from the cloak-room looking for all the world like

Honest Miner's.

For several minutes we stood by the shaft and watched with some misgivings the cages reeking with moisture as they came up with their load of ore or descended with their complement of men.

Changing Shifts.

An animated scene can always he witnessed at the time of changing shifts. Hundreds of men are collected around the shaft at that time, each one eagar to be the first to mount the cage as soon as it comes to the surface. Ordinary size cages, when densely packed, will hold about eight men. Considerable time is necessarily occupied in making these changes. When our turn came to go down we were placed in charge of a guide who was considerable amused hy the tenacity with which we clung with hoth hands to a supporting rod over our heads. During our descent he amused himself by singing snatches from Cornish songs, manifesting the greatest nouchalance, even to the extent of carrying his hands in his pockets. We, too, were soon disarmed of fear, and began to enjoy our ride in the "elevator" immensely. We could only judge of the number of stations passed hy flickering lights, which were visible only for a moment. At 1,000 feet beneath the snrface our cage came to a stand-still and we were told to disemhark. The time occupied in making the descent was between two or three minutes. After following our guide for some distance through a circuitous passage, in which we had the misfortune to bump our head repeatedly against the timhers overhead, we were eventually turned over to

Pluto,

In the person of G. D. Peters, underground foreman. To the kindness of this gentleman we were indebted for onr first opportnnity of witnessing mining operations underground. That the Crown Point mine contains an immense body of rich ore, was apparent even to our uneducated vision. A wide mineral belt extends downward from the 900 to the 1300-foot level, and perhaps further, with ore enough in sight to last for two or three years to come. Directly south of the Crown Point lies the Belcher, with more silver hid away in its recesses than ever the Inoas were reputed to possess. From the 1,000-foot level upward, in company with the foremau, we visited gallery after gallery, where hundreds of miners on either side were busily engaged in liherating ore with pick and drill. As regards climate, all of the zones seem to he represented in the mine. Upon our remarking to a half-naked miner at work on the 1,000-foot level that it is rather warm, he replied that it was comparatively cool in that locality. From the fact that we did not experience any difficulty in hreathing, we infer that the mine is well ventilated.

Timbering.

We understand that it is the practice in workiug out mines to commence at the hottom of the ore deposits and work upwards. The ore which is taken out on one floor is sent down to the next floor in a chute, from which it finds it way to the main shaft in cars. From 1300, 1200 1100 foot-levels, however, the ore is sent up to the 1000-foot level on a "giraffe," which runs on the incline. Drifting and timhering are inseparahle associated with each other. The timber commonly used in the mines are a foot square and about 7 feet in length. Fourteen sections or floors would he required to reach from one level to another. We were astonished to witness the enormous pressure to which the timhers in the lower levels are snhjected. Until filled in with waste rock, we were informed that as a general thing they do not stand plumb over three days. Several of the cross pieces we noticed were snapped off like a pipe stem. In many places a wooden cap a foot in thickness would be compressed to one-third of its original size, its fibres acquiring the consistency of lignum vitæ. The

Miners Hammering Away.

At the magnificent breasts of ore on either side of the main tunnel seemed to be a rollicking, industrious set of fellows. On their part we discovered no attempt at shirking. At every stopping place, in onr travels, we were asked to take a drink—of ice water with which the workmen are plentifully supplied. While stopping to chat with some of the men, a blast was exploded, as we supposed in close proximity to us, which caused us to take an immense leap into the air much to the delectation of the sappers and miners. While passing along a small tunnel we encountered an ore car from the Belcher, and learned that the Belcher people are allowed to pass their ore to the surface through the Crown Point territory. A little further on, in a comfortable stable, we noticed one of the Belcher mules, looking as fat, sleek haired and vicious as if working above ground. We judge that his eyesight is not seriously impaired from his long stay underground, for the reason that the tunnel in which he works is generally kept illuminated.

Reminscences.

Our good-natured guide, while taking us through the mine, entertained us with his historical reminiscences, every set of timhers seeming to be associated with eithor plesant or sorrowful recollections. "Right here, is the place where ore was struck," saidhe. (We didn't know exactly where we were at that particular time.) "If a person on the outside could have known about it he could have made a handsome fortune in no time." In another part of the tunnel he showed us where poor Hawkins got hurt, the other day by the letting off of a blast as he was passing along the tunnel. Our guide informed us that if the timbers of the tunnel could he exposed to sight in their present position they would present the appearance of the trestle-work of an immeuse bridge rnuning in a northerly and southerly direction. We parted company reluctantly with our pilot at the shaft and ascended to terra firma without further adventure, having had a very enjoyahle excursion.—*Virginia Enterprise.*

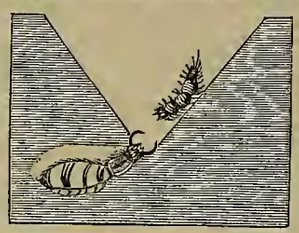
California Shad.

Those interested in the subject of fish culture will be pleased to know that the effort to stock our rivers with shad has attained the gratifying heginning of success. In June, 1871, the State Commissioner placed in the Upper Sacramento a large number of shad, procured of Seth Green, of New York. It was well known that these fish would migrate to the sea in the autumn, and also known that when old enough to spawn would return to fresh water, but it was not known as to whether they would return prior to that time, or whether the migratory instiuct was founded solely on the uecessities of spawuing. The fish were placed iu the river with but slight expectation of seeing any result of the effort for three years at least, at which age they first spawn. Australia planted her waters seven consecutive years before a single shad was caught therein, but the effort in California was destiaed to bear early fruit. Seth Green, who under the direction of the commission imported the fish offered a reward of $50 for the first shad caught ia the river. It now appears that the reward hss heen earned, though not yet claimed. Last summer two Indians caught in their traps two fish of a species wholly new to them. They were caught in the upper Sacramento, about four miles from its confluence with Pitt river. The Indians, not a little surprised at the capture of the finny strangers, and having never met their kind before, took them to Mr. Elmore, who resides on the river at that point. Mr. Elmore, suspecting the truth, took them to his neigher Hovey, who having resided on shad streams at the East, was competent to expert the case, and who at once pronounced them genuine shad. The Commissioners regard the story of this capture as wholly reliable, and feel safe in declaring the effort to stock the river with this valuable species of the finny tribe as successful. Apropos of this it may he stated that the Commissioners have recently placed ten thousand trout in the South Yuba, near the headwaters of that stream; also, a number of speckled trout ia the uorth fork of the American. Somebody claiming to be authority in the matter, has declared that an acre of water is equal to an acre of land in producing food to sustain humau life. If this he true, fish-culture is worthy the attentiou it is receiving.—*Sacramento Record.*

The Ant Lion.

In a late number of the *American Naturalist,* Mr. J. H. Emerton describes at length the peculiar habits and structure of the Ant Lion *(Myrmeleo immaculatus).* It appears that this ravenous little insect is endowed by nature with superior intelligence, and displays great skill and cunning in the entrapping and securing of its prey. Having determined npon a suitahle site, generally a clear sandy space under the shade of some shruh or boulder, it hegins the construction of a miniature pitfall by first thrusting its long jaws and fist head underneath the grains of sand, and then by a sudden upward jerk tossing them several inches heyond the edge of the pit. This operation is repeated until a funnel-shaped hole is excavated, as shown in the cut, the sides of which are as steep as the shifting nature of the sand will allow.

When completed, the ingenions little builder conceals his body at the hottom leaving only the extended jaws exposed. Here he awaits patiently until the unconscious victim, generally some smaller insect, approaches the edge of the ambuscade, wheu the disturbance of the saud above warns the watcher below, and he begins to toss up the earth from beneath, causing the sand on the shelving sides to slide



THE ANT LION.

down toward the centre, bearing with it the prey to within reach of the extended jaws. The lower sides of these are provided with tubular ohannels, that serve as ducts to convey tbe blood of the victim to the mouth of the captor.

Should the insect escape the first attack, and attempt with all haste to clamher up the sides of the pitfall, the ant lion immediately throws up a shower of sand and brings its victim dowu again. After sucking the body dry, the carcass is tossed beyond the limits of the pit, which is at once repaired, and made ready for the approach of avisitor. second

Ramie and Jute.

In the Report of the Commissioner of Agriculture for 1872, just received, we find au interesting allusion to the value and growth of two of the more recently introduced textile plants, Ramie and Jute, and speaking of them as likely to prove of importance, particularly to the Southern States; and as we have the climate of those States and some advantages they have not, for the growing of the plants alluded to, we extract from the Repor as follows:

Ramie and jute, fihrous plants which promise great value, have recently been introduced into the United States, and to some extent have been distributed hy the Department in the Southern States, the climate of which is alone adapted to their successful production. Of the former, little progress has been made in its use, because machinery has not been invented by which its fiber may be separated; bnt its value, in view of its fineness, strength, and beauty, will yet command an exercise of ingeuuity which will make its culture a profitahle industry.

Tho latter has already taken its place in the manufactnre of carpets and other fabrics as a snbstitnte for cotton, wool, flax, and hair. Each of these, I may safely predict, is destined to occupy an important place in the products and manufactures of this country; and it is not the least important cousideration that they may serve largely to diversify the crops of our Southern States, a subject which has commanded much of my attention, hecause of my conviction of the many beuefits which will result therefrom.

Where to Advertise.—A weekly family paper has great advantages for advertisers over a daily. It is generally on the table ready to be perused hy one and another for a week, and often several weeks at a time. Each copy is also read by a greater number of persons, often being loaned from family to family. Besides, the uumber of advertisements heing limited and generally of an interesting character, the chauces of each one being read are much greater than in a daily. A weekly also reaches all classes in all sections, who can scarcely be reached in any other way, as they do not take any other papers. These facts will be evident to any one who reflects upon the snhject.

Remarkable Expedition.

English Savans to Circumnavigate the Globe.

The expedition about to be dispatched by the British Admiralty to undertake a scientific circumnavigation of the globe is described at great length by *Nature.* The vessel set apsrt for this is the oorvette *Challenger,* of 2,306 tons, under the command of G. S. Nares, R. N., well-known as the author of a valuable work on sesmanship, who has seen a great deal of active service. formerly in Arctic exploration, and latterly in the Suez survey, which he now leaves to head this expedition. On the scientfic staffare, Prof. Wyville Thompson, F. R. S., as director; J. Y. Buchanan, of Edinburgh University, chemist; H. N. Moseley, of Oxford, naturalist; Dr. Von Willemoes Suhm, of Mnnich, naturalist; John Murray, of Ediuburgh University, natnralist. The three naturalists take charge respectiyely of the invertehrata, vertebrata, and botany. Prof. Thompson assumes the charge of the general zoological work. A photographer is also assigned to duty. The whole expedition is under the immediate direction of the Hydrographic Department of the Admiralty, and the ship is fitted out with a msgnificent collection of scientific apparatus.

The *Challenger* will sail from Portsmouth for Gihraltar, the first haul of the dredge heing made in the Bay of Biscay, if the weather should chance to be favorable. From Gihraltar she will proceed to Msdeira, thence to St. Thomas, the Bahamas, Bermuda, the Azores; from thence to Bahia, touching at Fernando Norohna; then across to the Cape of Good Hope, and after a stay in that neighborhood, southward to the Crozetts and Marion Islands and Kerguelens Land. A run southward will then he made as far as possible to the ice, and the course thence be made to Sydney, New Zealand, the Campbell and Auckland groups. Torres Straits, New Guinea, and New Ireland will then be visited. A long cruise of perhaps a year will then be made among the Pacific Islands; thence the expedition, passing betweeu Borneo and Celebes, and visiting Luzon and its neighborhood, will proceed to Japan, where a stay of two or three months is expected. Thence uorthward to Kamschatka, whence a run will be made northward through Behring's Straits, and then through the Aleutian Islands, southward to Vancouver's Island, and so through the deep Eastern region of the Pacific by Easter Island, and possibly by the Galapagos Archipelago, to the Horn, and thence home. The voyage is expected to take about three and a half years.

It is difficult (says *Nature*) to overestimate the immense benifit which science must derive from an expedition such as this. Apart from the results of intense interest which may be expected from the deep-sea work, the principal object of the expedtion, and which must go far to elucidate a snbject ou which our knowledge is at present of the most imperfect description, abundant opportunity will offer for the accurate investigation of the animal and vegetable life of many highly interesting and yet imperfectly known, or totally unexplored, regious. The investigation of the floras of such islands as Fernando Norohna and the Marion and Crozett gronp, cannot fail to yield most instructive results; and it is needless to speak of the intense interest which centres in New Guinea.

A White Pine Project.

The White Pine *News* says that the mining operations on Treasnre Hill, so far as they have been carried, have been sufficient to yield large retnrns from two or three mines; very satisfactory results for a time from some mines which have since cost all the profits and assessments in addition to prosecute the work of prospecting; and to exhibit to-day in the Ward Beecher, the North Aurora, and the Beecher Consolidated, and perhaps in the Anchor, splendid bodies of finest ores. A jar in the mining and milling interests comes down with us to a close approach of the severe winter in the front, and these splendid mines must stand almost nnworked till spring, for the lack of room to stack up additional hundreds of tons of fine ore. With what these mining operations have demonstrated, they have not settled the system or build of the mines on the Hill. Some persons, interested in the District, are discussing the project of a tunnel, to start in on the Hamilton and Shermantown grade, to run under Bromide Flat and through the Hill to the opposite caāon. This would settle the system of the mines, and at the same time douhtless hit upon deposits not cropping on the surface; and also afford a means of getting out ores to the mills at a greatly reduced expense, particularly in winter time. We trust the project will be put into shape; and see no reason why a moderate sum in Government bonds —say half a million—might not be obtained as a loan in aid of the work.

Manufacturing Enterprise.—The Napa *Register* says: "D. A. Manuel and Sawyer have pnrchased, on the east side of the river, opposite the Third street bridge, four acres of land upon which to erect an immense foundry and machiae shop. They have also entered into arrangements with Messrs. Mygatt & Hubbard, and Treadwell & Co., of San Francisco for the manufacture of gang plows and other farming implements upon a grand scale. We rejoice in this as a home enterprise, and feel assured of its success."

Useful Information.

Phosphorescence Produced by Decomposition.

Many kinds of fish, which can make no claim to luminosity when in life, become brilliantly phosphorescent after death. Mackerels and herrings especially, when their dead bodies are exposed for a short time to the air, becomes luminons in the dark, and have often appalled some rustic youngster by their strange phosphoric glitter as they hang outside a cottage door. Stretch forth your hand and touch them, and you will find your fingers covered with a greasy substance, and luminons, as if rubbed with phosphorus. If the greasy substance be separated from the dead fish, and placed on a plate of glass, it continues to shine in the dark. But, as in all other cases of phosphorescence, there is no heat—only light. When these dead fish are placed in sea-water, in a few days time they render it luminous—evidently from the luminuous grease permeating the surrounding liquid; moreover, the water shines everywhere with equal lustre, and suffers no diminution of its luminosity by being passed through a sieve. Water which has thus been rendered luminous loses its transparency, looks milky, and acquires a disagreeable odor; and its phosphorescence may last for four or five days. Dead animal matter of all kinds occasionally becomes phosphorescent. Peep some winter's night, into the larder, and perchance you will see—as Dr. Boyle once saw—a neck of veal gleaming all over with spots of light. You may fancy, as most people do, that this phoephorescence is a sign of decomposition, and that both the veal and the gleaming herring or mackerel ought to be thrown away. But this is a mistake; for it is a remarkable fact that this luminosity from dead animal matter always shows itself before decay begins, and either ceases at once or rapidly diminishes as soon as chemical decompositiou sets it. We may add that not a vestige of infusoria or other animalcule is to be found in this luminous matter when examined under the microscope.—*Belgravia.*

The New French Metre.—It might astonish unreflecting persons says the London *Telegraph*, to know of the prolonged and anxious precautions that have been taken in the preparation of the French Metre, which is to be the future standard of international measurement. After long discussion, and debates which turned on the millionth part of a millmetre, the learned men charged that this inquiry by the Academy of Science have reported in favor of the implement actually existing in the archives of Paris. Copies of this standard are to be delicately made, and furnished to the countries which accept it as a common canon. The length of the original is to be taken at the freezing point; the material of the authenticated copies will be composed of mixed platinum and iridium, and they will be constructed out of one and the same ingot. They will be heated for many days at a prodigious temperature, so as to be proof, as far as possible, against subsequent molecular action. Each metre will be stored up in company with extremely sensitive thermometers, specially manufactured and tested; and the divisions on each rod will be marked with micro-machinery constructed for that particular purpose. This might seem needless care, and, no doubt, the millionth part of the thousandth of a metre is no great matter to lose or gain, seeing that neither buyer nor seller could possibly be aware of it. But in reality, great issues depend upon the utmost attainable accuracy in establishing such a standard; innumerable operations of human life are founded upon it; and such anxious precautions are therefore the very veracity of mechanics, the intellectual conscience of commerce and mensuration.

A Cat's Dream.—Animals, especially the dog, cat, and parrot, often indulge in the luxury of dreams. A correspondent of *Land and Water* tells the following anecdote of a cat: "She was very still, and appeared to be fast asleep, when suddenly she sprang into the middle of the room, where she fixed her feet on a limited spot on the floor, to which also her nose was applied, as if closely grasping something she held in her claws. This continued for a short time, when the nose was gently raised, and the visible attention was directed to the feet, which still continued their grasp; but after a time one of them was gradually removed, and then the other, at which puss appeared greatly at a loss to imagine whether the imaginary object could have gone, so as to escape her grasp. She looked in various directions along the floor, with a foolish face of confusion; and then again her attention was directed to the spot on which the feet were first closely pressed, as if to examine closely whether the presumed escape had been by sinking through the floor; and this seemed unsatisfactory, the disappointed animal, now widely awake, returned slowly from the spot; but she returned more than once to re-examine the place, as if she found it impossible to comprehend how an object she had so plainly seen and grasped should have sunk into nothing. Many minutes elapsed before the cat appeared to be reconciled to the conviction that what had been a dream was not in truth a reality."

There is True Economy in Good Roads.

There is no economy in saving in "the spigot and losing at the bung." There is no economy in parsimony in road making and paying treble or quadruple to wagon makers, blacksmiths and harness makers. Uneven road beds, gulleys and boulders tax a man more heavily in purse, and are more vexatious to spirit than his part of the cost, constructing and maintaining a road "level and smooth as a barn floor." Men don't get rich, or are a long time getting rich, just because they don't begin right. What is the use of toiling to save crops, if a share of the profits is lost in getting them to market? A man starts to his nearest town with a ton of hay from which he expects to realize $10 to $15. He runs into a gully, tips over, and a half a day is lost to himself and team in getting straightened up; or he loses a tire, breaks some part of his wagon, or casts a shoe, because of a boulder or something else that shouldn't be there—out comes his purse for repairs, and away goes an hour or more of his time!

But the cost and loss of his time is not all—he gets fretted, worried in spirit, and becomes exceedingly unamiable, boorish and bearish. And this last is no first-rate evidence of his civilization—traced back to his imperfect road bed. A poor road in a populous community costs enough, incidentally, (and accidentally), in the course of twelve months, to macadamize its whole length, and to give something almost as durable as the "everlasting hills."

Our old system of road working needs alteration. It does not meet the wants of the people to-day. It is too antiquated and too imperfect to be recognized in harmony with the spirit of the age. It needs thorough revision. What scholar and philanthropist can devise a system that will combine thoroughness of structure, completeness of detail, and no waste of the people's money? Such a man will be the benefactor of the rural districts, and as justly entitled to reverential memory as any inventor of the age.

The Origin of Thunder-Storms.

Professor Palmieri's experiments at his observatory half way up Mount Vesuvins really throw great light on the philosophy of our thunder-storms. Having watched the changes of atmospheric electricity there for nearly a quarter of a century, he believes he has detected their obedience to certain definite laws. One of the facts he has established is, that the electricity of any station is always positive if there be no shower of rain, hail or snow falling within a distance of fifty miles, and provided there be no projection of ashes from the crater of the mountain. If a shower be falling within this radius, the following law holds good: At the place there is a strong developement of positive, electricity, round this there is a zone of negative, and beyond this again positive electricity. Should negative electricity be observed during the shower, it will be found to be induced by a more powerful one of positive electricity further away. All this had been ascertained by means of telegraphic communication with both neighboring and distant regions. There is no usual development of electricity except where and when the moisture of the air is being condensed. In a cloud from which no rain is falling there is no greater electrical activity than elsewhere. But the moment aqueous vapor begins to condense into drops, positive electricity is thereby created, and the greater in quantity the greater the precipitation by changes of temperature. When, therefore, this condensation is extremely rapid, a superabundance of electricity accumulates, which must find its way to the negative zone, perhaps, or to the earth below, by lightening discharges—in other words, thunder-storms are produced.

The Centre of Population.—By an interesting calculation, Professor Hilgard of the Coast Survey, shows that the centre of population of the United States, which is constantly moving westward, was, in 1840, at the Cumberland Mountains, in Virginia, in 1850 it moved westwardly sixty-seven miles, to the south of Parkersburg, still in Virginia; in 1860 it got as far west, about eighty-two miles, as a place south of Chillicothe, O., not far distant from the boundry of Virginia and Kentucky: in 1870 it moved only forty-five miles, and is now at Wilmington, Clinton county, O. The Professor deduces from his very curious calculations, that in the year 1900 the centre of population will be near Bloomington, Ind., about forty-five miles southwest of Indinapolis.

To Clean Cider Casks.—A good plan to cleanse musty or foul caks, is to put in a quantity of unslaked lime, and then pour in boiling water until the same is slaked. Put in the bung and shake until the water and lime have come in contact with every part of the barrel. Let it stand six or eight hours, empty and smell the cask, and if not clean, repeat the operation, and after having again emptied out the lime, burn a strip of cloth dipped in melted brimstone in cask, fastening it by the bung, and a cask must be foul indeed that cannot be purified by this process.

Good Health.

Spent Balls.

A spent ball striking with a dull thud like a stone thrown by a strong-armed man, often causes more pain to the man struck, and more commotion in the ranks, than a bullet that tore through a man's leg or arm. A spent ball always "slips up" on you. It always came when you least expected it, from an unlooked-for direction, and struck a part of the body not expecting to be hit. So it always produced a stunning effect. In some regiments spent balls were universally called "stunners," and very many men had painful and uncomfortable experience with them. Some day, the men lounging in the line of battle, protected by a hill, and listening to the volleys on the right, would be disturbed by the contortions of a man who had been asleep.

A spent ball had struck his foot, and without breaking the shoe-leather had made him crazy with pain. Another would be hit in the region of the stomach, and labor under the impression that his entrails had been torn out. Another struck on the hand, would yell out like an Indian, whereas had a bullet gone through his body he would have shut his lips and uttered not a groan. The boys had a theory that these spent balls came from the awkward squad of the enemy, and that the air up a little distance was full of them. The spent balls were no respecters of persons. They demoralize men in shoulder-straps as well as men in blouses. At Chickamauga General Whitaker, storming forward at the head of his brigade, was struck in the abdomen. Deathly sick and faint, he called to Gen. Granger.

"General, I am hit in a bad place; who'll take command of my boys?"

Granger replied, "I'll do it myself," and sorrowfully sent his favorite brigadier to the rear. Whitaker, riding along rearward, concluded to see the the extent of his wound. Unbuttoned his coat, found no blood. Underclothing was not stained or punctured. There was no wound in the flesh. Realizing that he had been hit with a spent ball, Whitaker wheeled his horse, and in a towering rage galloped back to the scene of battle. Dashing up to the commander of the reserve, he roared: "I'm not wounded worth a curse. I'll run this brigade myself;" and he did.

Tobacco as a Medicine.

A letter has recently appeared in the *Manchester Examiner* from a smoker who "has read with interest the various letters that have appeared in that journal on the tobacco question." This gentlemen, it seems, never knew a day's health until he took to smoking. Up to the age of twenty he never smoked, but he was always sickly, and during the winter months was much troubled with affections of the chest." Fortunately for him, at that age, on the recommendation, he alleges, of no less an authority than Prof. Huxley, he "began the use of mild tobacco;" and from that day forward he has enjoyed good health. He is no longer troubled with his cough in winter, nor, although he is of delicate constitution, has his memory or sight been in any way impaired. A short time ago he foolishly gave up the habit of smoking, for the sake of experiment, and denied himself the use of tobacco for two or three weeks. The consequences were most serious. All his old symptoms returned, and his cough became again so exceedingly violent that it nearly turned to bronchitis. On resuming his pipe, the affection immediately subsided. He accordingly now smokes from a sense of duty, "medicinally, and as a preventive." This painful story is calculated to throw additional difficulties in the path of the anti-tobacconists.

The Beard Healthy.—There are more inducements for wearing the beard than the mere improvement of a man's personal appearance, and the cultivation of an aid to the everyday diplomacy of life. The hair of the mustache does not only absorb the moisture and miasma of the fogs, but it strains the air from dust, and the soot of our great, smoky cities. It acts, also, in the most scientific manner, by taking the heat from the warm breath as it leaves the chest, and supplying it to the cool air taken in. It is not only a respirator, but with a beard entire we are supplied with a comforter as well, and these are never left at home, like the umbrella, and all such appliances, when they are wanted. Moffat and Livingstone, the explorers, and many other travelers, say that at night no wrapper can equal the beard. A remarkable fact is, too, that the beard, like the hair of the head, protects against the heat of the sun, as the thatch does the ice-house; but, more than this, it becomes moist with perspiration, and then, by evaporation, cools the skin. A man who accepts this protection of nature may face the rudest storm and the hardest winter. He may go from the hottest room into the coldest air without dread, and we verily believe he might sleep in a morass with impunity; at least, his chance of escaping the terrible fever would be better than his beardless companions'.

Ether vs. Chloroform.

If the force of statistics be of any value, ether, beyond question, is the agent which presents the most powerful claims, and must obtain our confidence as the safest anæsthetic. The reports of the Medical Society of Virginia during this season are conclusive. By combining American and British statistics the result is found to be as follows:

Agent employed.	Deaths.	Inhalations.
Ether	4 to 82,815	or 1 in 23,204
Chloroform	53 to 152,160	or 1 in 2,883
Mixture of chloroform and ether	2 to 11,176,	or 1 in 5,588
Bichloride of Methylene	2 to 10,000,	or 1 in 5,000

It is thus proved statistically that chloroform is eight times as dangerous as ether, twice as dangerous as a mixture of chloroform and ether, and, as far as experience goes, it is more dangerous than bichloride of methylene; in fact, chloroform is the most dangerous of all the anæsthetic agents in use. If statistics are of any value, these should be startling and impressive ones. The report of the London Chloroform Committee states as the result of careful investigation, that "ether is less dangerous than chloroform;" and that "with every care, and the most exact dilution of the chloroform vapor, the state of insensibility may pass in a few moments into one of imminent death;" and the latest surgical work from America advocates ether as the most suitable anæsthetic.—*British Medical Journal.*

Coloring the Eye.—Dr. R. J. Levis, of the Pennsylvania Hospital, has devised a means of coloring opacities in the cornea of the eye. He says: "The disfigurement of the glaring white opaque spaces of the cornea can be cured by indelibly tinting, so that if central, they shall show the blackness of the natural pupil, or if peripheral in location, the color of the underlying iris may be most deceptively imitated. Should even the entire cornea be opaque, a very natural imitation of the appearance of the whole circle of the iris and the pupil can be accomplished." The instrument used is a bundle of from three to six very fine sewing needles inserted into a handle. For coloring matter, ordinary water pigments are used, rubbed to a pasty consistence and mixed with a little glycerine. For the black of the pupil, Indian ink is employed. The surface of the opaque spot being wiped clear from moisture, the paint is applied thickly over it with a small pencil. The needle points are made to penetrate repeatedly and rapidly in varying directions, until much of the opaque surface is gone over with the pigment. Two or more repetitions of the process are required. The operation is said to be painless, and as the coloring matter is regularly tatooed into the tissues, it cannot be washed out by tears.

Buttermilk.—Hygienists assert that buttermilk is an excellent aid to digestion, and acts as an admirable substitute for fruit in Winter. They also advise it as a preventive of sickness in Spring. If invalids who suffer from indigestion would drink it at meal times, they would find it invaluable.

Persons who have not been in the habit of drinking buttermilk consider it disagreeable because it is slightly acid, in consequence of the presence of lactic acid. There is not much nourishment in buttermilk, but the presence of the lactic acid assists the digestion of any food taken with it. The Welsh peasants almost live upon oat cake and buttermilk. Invalids suffering from indigestion will do well to drink buttermilk at meal time.

Too Much Shade Unhealthy.—Mr. Greeley, a short time before his wife's death, said to a friend that the bronchial disease with which she was then severely afflicted, and which finally caused her death, was contracted by living in the "old house" upon his Chappaqua farm. That house stood in a forest grove which so overshadowed it that the sun was almost shut out. He said he tried to persuade his wife to let him cut away some of the trees, but she could not bear to see a single tree cut down. In time, however, the fatal disease got such a hold on her constitution that Mr. Greeley put up a new house on a sunny portion of the farm, where the family lived during the latter years of their residence there.

Medical Value of Asparagus.—A medical correspondent of an English journal says that the advantages of asparagus are not sufficiently estimated by those who suffer with rheumatism and gout. Slight cases of rheumatism are cured in a few days by feeding on this delicious esculent; and more chronic cases are much relieved, especially if the patient avoids all acids whether in food or beverage. The Jerusalem artichoke has also a similar effect in relieving rheumatism. The heads may be eaten in the usual way, but tea made from the leaves of the stalk, and drank three or four times a day, is a certain remedy, though not equally agreeable.

Wash for Sunburn.—Take two drachms of borax, one drachm of Roman alum, one drachm of camphor, half an oz. of sugar candy, one pound ox gall; mix and stir well for ten minutes or so, and repeat this stirring three or four times a day for a fortnight, till it appears clear and transparent. Strain through blotting-paper, and bottle up for use. It is said that strawberries rubbed over the face at night will remove freckles and sunburn.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

San Francisco:

Saturday Morning, Dec 21, 1872.

Legal Tender Rates.—S. F., Thurs., Dec. 19—Buying, 88¾; Selling, 90.

Table of Contents.

GENERAL EDITORIALS.—Christmas; The Coming Course of Lectures; The Diamond Fraud, 385. The Coming Expositions, 392. ILLUSTRATIONS—Close's Improved Expansion Rail and Chair, 385. The Ant Lion, 390. An Ant's Nest, 393.

MECHANICAL PROGRESS.—Proposed Novelty in Fireproof Buildings: Tensile Strength of American and English Iron and Steel; Barron's Steel Process; Cohesion of Manufactured Iron; Improved Construction of Tools for Turning Metals at Increased Speed; Steel Rails, 387.

SCIENTIFIC PROGRESS.—Extraordinary Meteoric Display—What has Become of Biela's Comet; The Molecular Phenomena of Evaporation; The Future of Science; Atmospheric Phenomene of the Boston Fire: New Meteorological Theory; Sensitive Streems, 387.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 388.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, and Utah, 388. Market Reports, 398.

USEFUL INFORMATION.—Phosphorescence Produced by Deposition; The New French Metre; A Cat's Dream; There is True Economy in Good Roads; The Origin of Thunder-Storms; The Centre of Population; To Clean Cider Casks, 391.

GOOD HEALTH.—Spent Balls; Tobacco as a Medicine; The Beard Healthy; Ether vs. Chloroform; Coloring the Eye; Buttermilk; To Much Shade Unhealthy; Medical Value of Asparagus; Wash for Sunburn, 391.

DOMESTIC ECONOMY.—Oatmeal Breakfast Cake; The Philosophy of Washing Flannels; To Boil Corned Beef; Observations on Preserves, the Boiling of Sugar; Cream Tapioca Pudding, 395.

MISCELLANEOUS.—Metallic Staples of the Pacific Coast; Tuolumne's Gold; Plumbago; The Comstock Lode; New Project, 388. Visit to the Crown Point Mine; California Shad; Ramie and Jute; Where to advertise; Remarkable Expedition; A White Pine Project, 390. New Volcanic Theory Anticipated, 392. Academy of Sciences, 393. Iron Work of Sacramento; Mining in Nevada County; Kern County Mineral Vein System; Oregon Mines, 394. Patents and Inventions; New Incorporations; Meetings and Elections, 398.

SEND IN YOUR SUBSCRIPTIONS.—By renewing subscriptions promptly, our subscribers will confer a grateful favor upon the publishers of this journal. It will save our mailing clerk, in many instances, the trouble of distributing and resetting your name and address. It will perhaps save us the time of an agent and his traveling expenses in politely soliciting your renewal. Suppose every department in the paper does not interest you, we publish a great variety, and does not the balance pay you? We really believe that our first-class publications have benefited the Pacific Coast community to that degree that every well-to-do person has been benefitted more than four dollars by their progressive and industrial influence, and that there is no danger of any one making a mistake or giving us more than value received by sending in their subscription. We shall continue to put the money sent us into improvements for the benefit of readers—and not into selfish and rusty pockets.

TO INDUCE SUBSCRIPTIONS, we will (as long as this notice appears) send from one to twelve copies of such back numbers as we may have on hand, of this journal, to one or more addresses, furnished us by *any* old or new subscriber who sends sufficient stamps to pay postage on the same.

FRUITS OF THE SEASON.—On this the 19th day of December, we will, though not to tantalize our Eastern readers, but just to show them how we are getting on with our winter, remark, that most of our fruit stands for the sale of fruits, etc., are what are known as *open stands*, simply a shop or store without doors or windows in front. That these stands are just loaded with apples, pears, and a half dozen of our best varieties of grapes, whilst oranges, limes, bananas, and pine apples are as plentiful as can be reasonably wished, all at low prices; whilst strawberries and green peas can also be found, but begin to possess somewhat the odor of silver.

LABOR.—Workmen and mechanics are very scarce in this city at present, and in the matter of building in particular are much wanted. There is a prospect of lively times in every department of industry and good wages are offered.

RAYMOND & ELY SUIT.—In the 12th District Court this week, the suit of McDermott against the Raymond & Ely Mining Company, was dismissed.

The Coming Expositions.

Extensive preparations are being made for several expositions, some of them to take place three or four years from now, and the commissioners of the respective exhibitions are judiciously taking time by the forelock so as to perfect all necessary preliminary arrangements. The importance of these exhibitions of the arts and industries of the world to our merchants, mechanics, inventors and manufacturers can scarcely be overestimated, and we do hope that California will be properly represented every where. The great

Centennial International Exhibition

Of 1876 is naturally of most interest to Americans. This exhibition, originating under the auspices of the National Legislature, controlled by a national commission and designed as it is to "commemorate the first century of our existence, by an exhibition of the natural resources of the country and their development, and of our progress in those arts which benefit mankind in comparison with those of older nations," should be made the greatest success possible. It is designed to bring together, within a building covering 50 acres, not only the varied productions of our mines and of the soil, but types of all the intellectual triumphs of our citizens, specimens of everything that America can furnish, whether from the brains or the hands of her children, and thus make evident to the world the advancement of which a self governed people is capable.

Commissioners from each State and Territory have been appointed to conduct the affair, and Joseph R. Hawley is President, and Lewis W. Smith is temporary Secretary. The California Commissioners are Messrs John Dunbar Craig and John Middleton; from Arizona, Richard C. McCormick and James L. Cooper; from Idaho, Thomas Donaldson and James S Reynolds; from Montana, William H. Clagett and Patrick A. Largey; from Nevada, Wm. Wirt McCoy; from Oregon, James W. Virtue and Andrew J. Dufur; from Utah, John H. Wickizer and Oscar G. Sawyer; and from Washington Territory, Elwood Evans and Alexander S. Abernethy. The commissioners have issued a circular asking the coöperation of the people of the whole country to make the Centennial celebration such a success as the patriotism and pride of every American demands. The commissioner has received no Government aid, such as England extended to her World's Fair, and France to her Universal Exposition, yet the labor and responsibility upon it is as great as in either of those undertakings. It is estimated that $10,000,000 will be required, and this sum Congress has provided shall be raised by stock subscription, and that the people shall have the opportunity of subscribing in proportion to the population of their respective States and Territories. Each one must contribute its share of the expenses and receive its share of the profits. The commission earnestly urges the formation in each State and Territory of a Centennial organization, which shall in time see that the County Associations are formed, so that when the nations are gathered together in 1876, each commonwealth can view with pride the contributions she has made to the National glory.

The Vienna Exposition of 1873,

Which we have heretofore briefly noticed is expected to be one of the largest and most comprehensive ever held. The Park in which the buildings are being erected has an area of over 900 acres, and the entire buildings and grounds will include an extent nearly six times larger than that occupied by the Exhibition at Paris in 1867. The Department devoted to the United States, in the main building, is favorably situated, being the one nearest the City, and directly in the path of those who may visit the building on foot or by the street cars. The United States Commissioner General, Thomas B. Van Buren, has issued a circular urging Americans to be well represented at this Fair, and will give any information in his power to those desiring it. His address is 51 Chambers street, New York. Mr. Guido Kustel, well known on the Coast as a mining expert, goes from this State, under the auspices of the Mechanics' Institute, and will be glad to do anything in his power to further the interests of the Pacific Coast.

A meeting of parties interested in the Exposition was held last Monday in this city, at which the following resolution was adopted:

Resolved, That all questions connected with the matter of the representation of California at the Exposition be referred to a special committee, to report at an early date.

The following gentlemen were appointed as the special committee: Professor D. C. Gilman, Washington Bartlett, Geo. Davidson, A. S. Hallidie, L. A. Garnett and A. Gansl. Mr. Wm. T. Coleman in a communication sent to the committee, suggests that a Commissioner recommended by the Mechanics' Institute, should be appointed to represent the mechanical and mineral interests of the State. He should be provided with models of every different kind of machinery used in the reduction of every kind of ore, such as stamp mills, amalgamating pans, etc., etc., and specimens of gold and silver bearing ores, with large photographs of hydraulic mining, samples of gold bearing gravel, etc., etc.

The names of those, who are giving their advice and assistance to the Commissioner, embracee prominent and well known gentlemen, which gives additional assurance of success. Professor Wm. P. Blake in connection with mining and metallurgy; agriculture, horticulture and forestry, Henry W. Sargent; chemical industry, Prof. Chas. F. Chandler; substances of food as products of industry, Prof. E. N. Horsford; textile industry and clothing, Dr. Isidor Walz; leather and india rubber industry, Jackson S. Schultz; metal industry, Abram S. Hewitt; wood industry, Geo. E. Harney; stone, earthenware and glass industry, Prof T. Sterry Hunt; small wares and fancy goods, Chas. L. Tiffany; paper industry and stationary, John Priestly; graphic arts and industrial drawing, John E. Gavit; machinery and means of transport, Prof. Roht. H. Thurston; philosophical and surgical implements, Dr. F. A. P. Barnard; musical instruments, Theodore Thomas; art of war, General Q. A. Gilmore; the navy, Isaac Newton; civil engineering, public works and architecture, Wm. E. Worther; the private dwelling house, its inner arrangements and decorations, Calvert Vaux; the farm house, its arrangements, furniture and utensils, Orestes Cleaveland; national domestic industry, Salem H. Wales; organization and influence of museums of fine arts applied to industry, Howard Potter; art applied to religion, Dr. C. H. Potter; objects of fine arts of the past, exhibited by amateurs and owners of collections, John T. Johnson; fine arts of the present time, George P. Putnam; education, teaching and instruction, Judge H. C. Van Horet; history of inventore and industry, Prof. Samuel D. Tillman; history of prices and representation of commerce and trade, Francis A. Stout; and charities, Chas. L. Brace.

The exhibition, the commissioner assures us, will not be a mere advertising agency, but a great gathering of the productions of all the earth, and a friendly contest for natural superiority. There are some features of the present laws of most of the European countries which are objectionable to inventors. A patentee is required by the laws of Austria to manufacture the patented article in that empire within one year from obtaining the patent or the latter becomes void. The commissioner says that the desire, however, among the Austrian and Hungarian people to secure a respectable display of American machinery and inventions is very strong, and the authorities are expressing their determination to do all in their power to prevent inventors and patentees against piracy and annoyance. A law has already been passed by the Austro-Hungarian Parliament, granting the right to every exhibitor to obtain from the General Manager a certificate free of charge, which certificate will act as a full patent during the exhibition, and for two months afterwards, and may then be turned into a patent by the payment of a fee of less than eleven dollars.

On the 6th of April, 1872, there was ratified between the Governments of Austro-Hungary and the United States a treaty upon Trade-marks, which provides that any trade-mark used in either country, to designate the origin or quality of any article, shall fully protect such article, and places American owners and inventors, when using such trade-mark in Austria, in the same position as Austrians occupy in our own country. It is to be hoped that, among other things, Mr. Kustel may be able to take from California to Vienna a complete quartz-mill, with all the late improvements, so as to show the mining-men there a mill in practical operation.

SECRETARY OF THE INTERIOR.—We have received the Annual Report of the Secretary, showing the operations of the Department for the year 1872.

Mr. Mallet's New Volcanic Theory Anticipated.(?)

In our issue of Dec. 14th, we made reference to the theory respecting volcanic energy, recently put forth by Robert Mallet, the eminent English seismologist—a theory which seems to have met with almost universal acceptance by scientists everywhere, and which promises to take the place of all others in accounting for the various phenomena connected with volcanic action, earthquakes, and the elevation of mountain ranges.

Mr. Mallet shows that the hotter internal portion of the earth must contract faster than the relatively cool crust, and hence that the shrinkage of the crust is competent to occasion all the known phenomena of volcanic action. He also recognizes therein the origin of earthquakes and of the changes of level on the earth's surface.

This is done by applying thereto the modern theory of heat as a mode of motion. As the solid crust closes in upon the shrinking nucleus, the work expended in crushing down and dislocating the parts of the crust is transformed into heat, by which, at the places where the process goes on with greatest energy, "the material of the rock so crushed and of that adjacent to it are heated even to fusion. The access of water to such points determines volcanic eruption."

Mr. Mallet's theory is also completely opposed to the ordinary idea that mountain elevations are the result of *upheavals;* on the contrary he holds that they have been formed by the *subsidence* of the valleys.

Our purpose, in this second reference, is to call attention to the fact that many of the fundamental ideas were previously put forth by J. S. Phillips, M. E., of this city, in his "Explorers', Miners' and Metallurgists' Companion," published at this office, two years ago. In proof of this fact, we quote from that work as follows;—In regard to the heat-generating effects produced by the contraction of the earth's crust, Mr. Phillips says on page 20: "After billions of cycles had passed away, when the lighter granitic exterior of the earth became from molten to *plastic* and partially solid condition, we will consider what actions must have taken place in reference to the general contraction that produced the irregular contour of surface and subterraneous cavities. Previous to this it may be safely supposed that its surface was a regular and comparatively smooth globe, which was surcharged and enclosed with oxygen, hydrogen, and all other inflammable gases or substances, and largely fluxed with potash, soda, lithia, lime, magnesia, sulphur, iron and manganese, it must have possessed a well-fused molten envelope of granitic slag and surface-dross. Until this settled almost to solid rock, it would be drawn by gravitation directly downwards in close contact to the still molten interior, but at a certain stage of solidification, because it naturally contracted less in cooling than the next interior, hotter molten mass, this vertical action of the outer crust would cease, when the contraction of the molten interior being further hastened, by the latter being accelerated by the evulsion of gaseous elements from the molten state, immensely extensive subterranean arched cavities would be formed under the superimposed spherical segment of granitic crust; which then partaking of lateral thrust, from solidity, the abutments of these all-sufficiently vast arches would give way, under the increased pressure, and consequently more *plastic condition*, and the mountains be uplifted at the lines of greatest pressure, or valleys and extensive plains sink, by mere straightening, as the ocean beds, to rest on the interior until a repetition ensued."

The "more plastic condition" was of course considered due to the heat generated by the "pressure," as is evident from the first two lines of the quotation, and elsewhere throughout the work.

On page 26, Mr. Phillips says:—"These principles of heat and pressure have not been sufficiently studied or experimented on by geologists," etc. The depression of the valleys, rather than the uplifting of the mountains, is more fully set forth on page 25, as follows:—

"During these formations, the earth's crust or hollow shell would continue to be violently compressed in circumferential directions, and being solid it would, from its own gravitation, as it endeavored to follow the still faster contracting interior, crumple and distort certain sections of least resistance into rolling surface contour of hill and dale. In such a state of comparative homogeneity the partial invasion of volcanic fires had not at this early period really uplifted any mountains; but their apparent elevations existed more from the above causes, and a loitering behind of such portions, during the general travel, when urged by contraction and gravitation towards the center of the earth."

And again, referring to the carboniferous era, he says, on page 49—"In the early times

the crust had not solidified, but to a comparative slight depth; aad, consequently, the aettlings, or deviations from existing lines of surface and contour, to follow the contracting interior, were more easily accomplished than is the case now with the deeply solidified settled shell.

It may he douhted if extensive mountain chains, apart from volcanic action, have at any time really arisen, or increased distance from center, seeing that the trifling length of line of their hight, aa compared with the radiua of the earth, is hut from two to five miles out of nearly 4,000, or generally much less than one part in a thousand; the whole surface has settled more than this, and the ocean beds, by sinking faster than the mountains, the latter, hy lagging, appear to be elevatod.

In view of these unmistakahle facts—of the several growtha and burials of the coal seams, with their similar anterior and posterior strata—it is far more natural to suppose that this *difference of contractional travel, or settling of the surface*, had causcd these changes, than the real uplifting of such extensive regions; it appears strange that so little differenca existed on a contracting globe of such diameter, as the smallest metal globe shows, on solidification from molten to solid state, a very much greater disparity.

Many other passages might he quoted to more fully establish the fact of priority, as ahove, in setting forth the "new theory" of mountain-formations. Wa will close hy simply adding tbat Mr. Phillips, in the work referred to, argues the subject of pressure and consequnent production and increase of sensible heat, in a somewhat lengthy and ahle manner in his second chapter treatiog of the secondary rock formations, which shows that he is familiar with those principles of action.

Academy of Sciences.

The last regular meeting of the California Academy of Scienoes for the year 1872 was held on Monday evening, Professor Davidson in the chair. Professor D. C. Gilman and A. De Tavel were elected members.

The contributions to the cabinet received, comprised the ribs, vertebra and fin bones of a humpback whale caught in San Lnis Obispo, also parasites from the whale, presented by Captain Scammon.

A large specimen of borate of lime, containing 50 per cent. of borassic acid, from the claims of the Borate Mining Company, twenty-five miles from Crescent City. Specimens of this same snbstance, which were atoms in size compared with the piece in question, have been exhibited in the British Museum as cnriosities. Until the discovery of the deposits on this coast, the borate of lime had never been found in such huge masses.

A collection of shells from the various localities were presented by Henry Hemphill.

An interesting paper by Professor Dall, of the United States Coast Survey, was read by the Secretary, the subject heing preliminary descriptions of the new species of mollusca from the northern coast of America.

Sun Spots and the Periodicity of Floods.

Dr. A. W. Saxe said he had been a resident of this city since 1850. He had watched the character of the seasons since that time, aud from conversations with the old inhabitants of the conntry, the Spauiards, he had been ahle to trace back very reliahly the periods of excessive rain-fall since 1832. Having read some portions of Humboldt's "Cosmos" as to the obscuratiou of the snn by spots, their decennial increase and diminntion, and their effects upon the magnetio phenomena of the Earth, he had heen led to examine the matter, and had found that onr flood seasons corresponded very nearly with the period of minimum obscuration of the sun.

The President said the periodicity of the sun's spots, and of the variation of the magnetie needle has, from latest observatious and discussions, eleven years and 3-hundredths of a year. There was a saying in the West that the floods of the Misaissippi occurred every nine years. Whether any accurate record had been kept he did not know; hut if there was a cosmical cause it was more likely to have a regular period than not.

In reply to the President, Dr. Saxe said he had not been ahle to get a perfectly accurate weather-tahle. He had taken his data partly from the memory of old residents as to floods that had overflown the country.

Dr. H. Gibbons had some doubt as to whether the ten-years theory could be snstained in regard to our Winters. The weather periods were very pliable, and facts ought to be established sufficiently before explanations were given. He had examined the weather tahle, and there was certainly hardly any data for the inference of every tenth year being an abundantly rainy season. For two or three successive periods there had heen rainy Winters near the tenth year, but there had heen Winters still more wet occasionally in the intervals, and it was quite likely that if two or three other figures were taken besidea ten, a similar inference might be drawn with regard to the last twenty-three years. In reference to almost any rules that could he deduced, he had very freequently, in casting his eye over the seasons to which his record referred, come to conclusions.

Now he thought he had got a rule that hitherto had held, hut almost invariably the very next occnrrence violated the rule, and the rule was gone as soon as it was deduced. The fact was, it required a very much longer period of tima than twenty-threa years to establish any rule in regard to weather. In Europe, where they had heen examining this subject most minutely for centuries, they had not yet adopted or come to any conclusion ou the snbject. Thera was no means of predicting the character of the coming season. In the Atlantic States, where observations extended bsck for the greater part of a century, nothing more conclusive had been ohtained with regard to the severity of the approaching winter than the indications of a goose's honc, perhaps, or the sayings of some Indians, or the doings of squirrels or some other animals. The scientific data furnished no record upon which to estimate the character of the coming season, and it was hardly fair to conclude that here in California, 22 or 23 years of experieuce would furnish us with rules. Of course, he did not wish to discourage inquiry, hut the statements of old inhabitants as to the weather were to be takeu with a great deal of allowance. It was very seldom that any of these confident statements were sustained by the result.

A Scientific Library.

The President said that Professor Gilman had been examining the different public libraries, and some private libraries of the city, and was astonished at the number of scientific books there—books which represented series of philosophical transactions, etc., although no one library contained them all. Professor Gilman had made the suggestion that it would he of interest to scientific men to have a catalogue made np from the different collections, so that in collecting hereafter no duplicates should be ohtained until a fnll set of the different scientific pnblications had heen secured. In the meantime, persons could refer to Bancroft's private library, and the Mercantile, Odd Fellows' and Mechanics' Institute Libraries. The suggestion struck him as a very good one—one that every scientific man wonld wish to see carried out—and he would he one of three to assist in making the catalogue. German scientific literature was very rare in the city, and they knew that that literature was very rich.

The annual meeting of the Academy will he held on the 6th of January.

Oaklann Bar.—The har at the mouth of San Antonio Creek, which has heen a great hindrance to traffic hetween this city and Oakland, is to be removed, and a contract has beeu awarded to E. B. Bishop for dredging it. He is to excavate a channel 4¼ feet deep at lowest tide, and work is to be completed hy the first of next Septemher.

Ants at Home.

For the entertainment of our readers we present an illustrstion representiog the home aud domestic life of the ant. Familiar as these little creatures are to almost every one, few are familiar with their natural history; and finding an interesting article on this aubject in the *School Day Visitor*, we appropriate it entire.

"Ant nests or homes are called ant-hills, hecause of the hillock which they huild up hy the dirt which they remove from the tunnels and chambers of the nest. These ant-hills serve as an outer protection of the avenues and halls which are excavated under the surface. The entrance to the uest is simply a hole or tunnel hollowed out in the soil, and which the thrown-out materials conceal. As the excavation goes on, and the tunnel hranches out into a lahyrinth in all directions, the pile of earth and ruhhish grows larger. The interior consists of corridors, landings, chambers, and spacions rooms

AN ANT'S NEST.

communicating with each other hy long aud short passages. All these passages lead to one central and grand gallery, loftier than others, and having its circular ceiling supported with columns. The beautiful illustration our artist has given us represents the interior of an ant-hill drawn from nature; and it will help you hetter to nnderstand the wonderful construction of the home of the ants. Outside of the hill you will see some ants occupied in drawing milk from plant-lice.

This custom is so strange that I mnst not pass over it. Ants are very fond of a peculiar liqnor which plant-lice secrete and store up in their abdomen. By means of their *antennæ*, which I have already described, the ants persuade the plant-lice—called *aphides*—to disgorge this liquor drop hy drop, which they immediately appropriate to their own nse. These *aphides* are often captured by the ants and taken into their nests, where they are carefully watched and kindly treated, in view of the henefit they expect to derive from them. So you see that ants hold property in stock, as many men do. And they raise them, too. For they sometimes hring into their nests the eggs of plant-lice, and tenderly eare for them till the insect is full grown snd is ahle to reward their kind nursing hy a rich supply of such milk aa the ant likes. Sometimes war arises between two ant repuhlics for the possession of these *aphides*. And when such war takes place, it is very bitter, and the aphides are made to suffer many wrongs even from those who pretend to be their friends. There is nothing in insect-life more interesting than the domestic hahits of ants, which in the different species are nearly the same. The females live together in the utmost harmony. They have no nests, like birds, in which they lay their eggs, hut they deposit them wherever they happen to be while walking ahout. The workers pick them np immediately and carry them to the chambers set apart for them. Of them the mothers have no care whatever. All their maternal love and anxiety seem to be transferred to the workers, and carefully and affectionately do they take care of the tender and dependent yonng committed to them. In abont two weeks the egg is hatched, and the ant appears in its *larva* state, in which it looks very unlike the fnll grown ant. The nurses are obliged to gather for the yonng, each day, the provision destined for their food.

They put them in the open air during the day. And that the nnrses may know when the sun appears and shines on the hill, sentinels are placed just nnder the roof of the nest, who observe the rising of the sun, and when they are assured of the fact, go to tell it to those that are watching the *larvæ*, hy tonching them in an intelligent way with their *attenuæ*. In a few seconds all the avenues are crowded with workers carrying the young out of the nest to put them on the top of the ant-hill, that they may receive the benefit of the snn's rays. When the snn's heat hecomes too great, their careful gnardians remove them to chambers not far from the top of the hill, where the heat of the sun is more mild.

When the *larvæ* are ready to change into their *pupæ* state, the workers brush them clean, distend their skin, and thus fit them for the remarkable change they are about to nndergo. The *larvæ* then spin for themselves a silken cocoon of a close texture and a gray or yellowish color. When they are ready to escape from their cocoon, the workers tear the silken covering from the *pupa*, and thus assist to affect its deliverance. They then watch over the newly horn, feed it, teach it to walk, and never ahandon it till it can help itself.

Paul Process.—The last steamer to Australia carried over from this city one of Mr. Almarin B. Paul's mills, for the largest metallurgical works in New Zealand. The proprietors of the institution have heen for soma time experimentiug with the electro-chemical dry amalgamating harrel process, on a small scale, and the results of their investigations must have heen satisfactory, or they would not have ordered this mill. The machinery was constructed at the Miners' Foundry, in this city, and was shipped ready to he put np on its arrival. Our English friends are nsually so exhaustive and practical in their trials of anything that pertsin to machinery, etc., that we may expect a detailed account of the experimeuts with Mr. Paul's apparatns as soon as sufficient time shall have elapsed. There is no reason why a hrisk business should not spring np with the Australian Colonies, in the matter of mining machinery, and we hope to hear of more experiments hefore long. As remarked in another column of this issue, our foundrymen should take steps to be properly represented at the coming exhibition in Australia.

Mining ann Scientific Press.—We have received an order from the Boston Public Library to send our paper regularly to that address, which snggests to us that other libraries in the Eastern States should keep on file one of the few mining papers in America, and the only one published in a mining commnnity. It would not be amiss to procure hack volumes of the Mining ann Scientific Press as a matter of reference in connection with the rapid progress of this coast in mining and mechanical industries.

San Diego Mines.—The recent results at Julian and Banner districts, in San Diego county, are very enconraging. No bad weather has as yet interrnpted operations. On the 11th inst., 24 tons of Helvetia ore yielded $20 per ton; ore from the Good Hope $27 per ton; and 16 tons from the Van Wert $48 per ton.

Holcomb Valley Mines.—A dispatch from Los Angeles states that the Holcomh Valley mines have heen sold and transfer made to an English company, who incorporate with a capital of £40,000. The purchase inclndes 100 acres of gravel deposit. The eight-stamp mill is to be supplied with 20 new stamps.

The sum of $3,000 was cleaned up from a 10-days run on rock from the Vnltnre mine, Baker county, Oregon, last week.

Domestic Economy

Oatmeal Breakfast Cake.—This is made of coarse oetmeel, with water enough to satnrate it, and little or no selt. Pour it into a beking tin, helf an inch or three-qnerters deep, shake it down well, end when thie is done it shonld be eo wet thet two or three spoonfnls of water shonld run freely on the surface. Put it in a quick oven and bake twenty minutss. Eat warm. It will bs as light and tender as the best "Johnny caks," or else you have wet it too much or baked it too long. This is one of the most accommodeting baked dishes that can he made. It will do very nicely with a little longer time, if the oven is not quite hot. If it will not bake there at all, pour it into a fryiug-pan, cover it close and set it on the top of the etove, where it will even beke in fifteen minutes. For a hurried breakfest and a slow coel-fire, it it is invaluable. Scarcely any wholesome thing in the breed line can be prepared more readily. It can be made still thinner and baked qnicker. It is good, either crisp or moist. For emergencies alone, every house-keeper will find it convenient to be able to make the breakfast cake. Many use oetmeal mixed with buckwheat, wheat or corn, for griddle cekes. For this use it should be cooked first. Take, sey one-half pint of the porridge or the mush, diffnse it in one quart of water and add the wheat meal, sifting it in and stirring slowly.—*Western Rural.*

The Philosophy of Washino Flannels.—Many persons buy flannel partly cotton to avoid the shrinkage in washing which is supposed to be inevitable. We have in the honse all wool Shaker flannel which has been washed every other week for two years, and although nearly worn ont the shrinkage is scercely perceptible. The secret of washing lies in two perticulars. First, the soap used must contein no resin, as this hardens the fibres of the wool. Flannel eoap, so ealled, is manufactured by our leading soap boilers, and differs from other lanndry soeps chiefly in conteining no resin. Second, no water below 110° or 112° Fahrenheit ever comes in contact with the flannel. Our white flannels take precedeuce over all the rest of the washing. We fill the Doty washer with soap suds, pass the flannels through it, wring them out, scald in blue weter, wring agein and heng out immediately, then go on with the rest of the washing. Blankets are weshed in this way as easily as sheets, and feel as soft and look as nice almost as when they cbme from the store. If one hes no washer, with a wringer and a pounding barrel, blankets and flannels need never come in contact with any bnt boiling water,—*Cor. N. Y. York-Tribune.*

To Boil Corned Beef.—If the piece is very selt, let it soak over night. If young beef and properly corned, this is unnecessary. For boiling, throw cold water over it after washing off the salt, letting the meat be well covered. The rule is twenty-five minntes to a ponnd for boiling meats, but corned beef should never be boiled; it should only simmer, by being placed on a part of the range where the simmering can be nuiuterrnpted from four to six hours, according to the size of the piece. If it is to be served cold, let the meat remain iu the liquor nntil cold. Tough beef can be made tender by letting it remein in the liquor until the next day, and then bringing it to the boiling point jnst before serving. For rnmp pieces this is a snperior method. A brisket or plate-piece may be simmered until the bones can be easily removed; then fold over the brisket-piece, forming a squere or oblong piece; tie over it a piece of muslin, place sufficent weight on top to press the parts closely together, and set it where it will hecome cold. This gives us e firm, solid piece, which, eeten in slices, is a delightful relish.—*Hearth and Home.*

Observations on Preserves, the Boiling of Sugar.—All preservee ehould be kept in a very dry plece, and so covered as to exclude all air. If a very small quantity of suger hes been used, a warm plece does no harm, bnt when not properly boiled, that is, boiled sufficiently long, but slowly, heat makes them ferment, and demp makes them mouldy. For the first two months efter they are made sweetmeats should he inspected frequently, that they mey be reboiled in case they are not likely to keep.

Boiling the sugar is the great art in prescrving. Few people are aware that in two or three minntes a syrup over the fire passes from one gredation of boiling to another, celled by confectioners "degrees of boiling." Attention is only drawn to this fact in order to gnard against *under boiling*, which prevents preserves from keeping, and against too qnick aud too long boiling, which makes them candy.—*Ex.*

Cream Tapioca Puddino.—Soak 3 teblespoonsful of tapioca in water over night, ponr off the water and put the tepióca into a quart of boiling milk, and boil ten minutes. Beat the yolke of fonr egge with a cup of sugar, add 3 tahlespoonsful of prepared cocoanut, and etir in and boil five minutee longer. Pour into a white pudding dish—beat the whitee of the fonr eggs to a stiff froth with three tablespoonefnl of eugar. Put thie over the pudding, sprinkle prepared cocoanut over the top, and brown five minutes.

Apple Fritters.—Thie is a favorits dish with meny, and often prefsrred to dumplings. We like them prepered thus: Meke a batter, not very stiff, with one quart of milk, three eggs, and flour to bring it to a right consistance. Pare and core helf a dozen lergs apples, and chop them well in the batter. Fry them in lard, as you would donghuuts. For trimmings, we like powdered white suger bsst, though good brown sugar will do.

Patent Flour.—Take 6 lbs. whsat flonr, mix 5 tse-spoonsful dry carb. sode (carefully pulvsrized) through it; then 7 do. cream tertar, and 6 do. of salt. Incorporats these, end you have rissn cakes at hand, to which add either milk or water, shortening or not, as suits, and you heve ssveral kinds or what is called soda cake. To this quantity of flour ¼ lh. bntter wonld answer.

Cleaning Stoves.—Stove lustre, when mixed with turpentine and applied in the usuel manner, is blecker, more glossy and durable then when mixed with any other liquid. The turpentine prevents rust, and when put on an old rusty stove, will make it look as well as new.

Wistaria Versus Flies.—A New York housekeeper has discovered that the wistaria creeping plant will keep out honse-flies. The pestiferous insects will not enter a window where one of these creepers is growing.

Iron Work at Sacramento.

The wrough:-iron depertment of the Central Pacific Railroad works in this city, says the Sacramento *Record*, has on hand at this time the heaviest job of forging ever undertekeu on this coest, being the manufacture of a wrought-iron main shaft for the bay steamer *El Capitan*. The shaft is to be twenty-eight feet in length; diameter of bearings, fourteen inches; diameter between bearings, eleven and a helf inches, and the work when completed will weigh six and one-helf tons. Aside from the messiveness of the work undertaken, there are other features of highly interesting siguificence. This shaft is being wrought from scrap iron, including the smallest anvil chippings, with scraps weighing from one-fourth of a pound to ten pounds. In this process all the scrap iron obtaineble is utilized. To present it in detail the process commences with the

Scrap Pile.

The screps are piled on a board in dimensions about 12 by 16 inches, the piles rising to the height of six inches. The piliug requires expert and skillful hands, and are so builded es to stand interlocked by the longest scraps used, the interstices being filled with the smellest scraps used. These weigh 150 pounds each. Six of these are placed in the "Bloom Furnace" at one time. The boards are consumed at once, but the entangled scraps lay together in the fire, and when in bloom from the intense heat, is lifted from the fire with bars. This bloom is speedily converted into a sleb under a steam hammer, the drop of which weighs 3,600 pounds. The ber of iron thus produced is equal if not

Superior lo the Besl Norway,

Being completely withont grain, and sustaining the pnnch without the least sign of check. The coal used is a Welsh bituminous coal, costing at the furnace $13 per ton. Careful estimates prove thet the iron in the slab costs less than four cents per pound. Bar iron of this size costs six csnts in the market, and the quality is much inferior. The scrap waste is twenty-two per cent.

The Slea ner Shall

Under consideration is made from the slah iron above described. A "porter bar" is used to huild npon. With this har the slabs are handled. A welding bloom in the constructiou of the bar reqnires one and a half hours iu heating. After the welding, a finishing and rounding heat requires three-fourths of an hour in heating. After finishing the sleg eud of the shaft is screped, end more sleb is added. Thus the ponderous shaft grows in length and is finished smooth and round by water-hemmeriug. The work when finished is as if rolled. The cntting of the fag end of the sheft showed that the fourteen inches of diameter was solid throughout; not a flew or double is revealed. The work began on Tuesdey, the 3d inst., running two shifts of men; seven in the deytime end nine at night. It will be finished by Thursday. When done, it is estimated that it will cost seven cents per pound. A sheft of this size in the rough, would cost in the Eastern markets fourteen cents per pound.

The Bloom Forge

Used in this work has en exterior measnrement of eighteen by seven feet. It is run by a steem blast. The boiler in which steam is geuerated to run the blast is placed over the furnace so that the blaze from the latter passes through it, thus using the coal for a double purpose. All the appliences nsed in this work are massive. The crene, the furnece aud the hammer are proportioned to the ponderous task, and to watch its progress is

A Spectacle of Fascinaling Interesl.

As the mighty iron column comee out from under the hammer—smooth, round and eolid—itie with difficulty that belief is retained of ite having been wronght from the infinite number of emall scraps; nor can the unpracticed eye see in the huge piles of scraps remaining, the possibility of another such a column. The welding blooms under the hammer dazzle the eye, and the intense hsat drives the spectator to a safe distance. The brevs and stalwert workmen, howevsr, stend into the work, which, under the pounding blows of ths hemmer, hes mors ths ssemings of a gallantly-sustained battle than a peacsabls process of manufacturs.

The Result of Ihe Experimenl

Has proven setisfectory, and hes significance thet will be highly gratifying to this city. It is fully dsmonstreted that bar-iron cen be produced from scrap chsaper then it cen be imported and sold, while the quelity of iron produced is greatly superior to the iron of commerce, or of bsttsr quality then the rolled iron of any country cen be. It is also certain now that ths heevy steamsr work of the bay will be dons hers. It is further ascertained thet ths works of the road ars competent to auy mechanical emergency; and this confidence is further proven by the fact that the construction of

Ten Locomolives

Will be commenced at once. These are to be constrncted entire in the shops here, with the single exception of the steel tire for the driving-wheels. The frames will be made from scrap, and as also the axles and all other heavier parts. Thus the railroed works of this city have grown and devcloped into manufecturing establishments of the first maguitnde, and Sacramento mey rejoice in being the seat of the most considerable and vigorous mannfacturing interest on the coast. We acknowledge onr indebtedness to Superintendent Towne, Mester Mechanic Stephens, and Mester Irónsmith Leshells, for iuformation and courtesy. During the progress of the work of forging the shaft, a large number of persous have visited the shops, and es a knowledge of the interest attached to the undertaking exteuds, the number of visitors increases. The work will be finished by Thursday of this week, and a visit, particularly at night, will interest aud amply repay the intelligent visitor.

Mining in Nevada County.

Teu days ago it looked as though the rainy seeson was upon us, says a *Bulletin* correspondent whose letter is dated from Nevada City, but only enough water fell to set the ranchers plowing. Very few of our large hydaulic miners are yet ready. Tons of iron have been nsed, and thonsands of feet of new pipe made in this city this seeson for miner's nse, and teams are deily hauling loads of it to the points where it is to be used.

The Old River Channel.

Jacobs & Sargent's claims, at Queker Hill, were sterted up at oue poiut during the last rain. These famous claims are on one of the old river channels, and surveys made on our county roads by the lete County Surveyor, have demonstrated that the course of this river was from sonth to north; thet Dutch Flat (Placer county) on the south, and Columbia Hill (Nevada county) on the north, are on the seme chennel. One of the most favorable points for observation on this line is at Blue Tent, where the bed-rock is 300 feet lower than et Queker Hill, which is distant about seven miles. Here cen be seen where and how the present stream—the South Yuba—broke throngh the old chennel, which wes about 3,000 feet wide here, and one can look directly across the river upon its plainly traced continuence to the north. There is not another as good a point in the county for the development of a first-class hydreulic mine as exists here. The gorges and cañons are very abrupt, and tunnels of from 500 to 700 feet in length would pierce the inexheustible gravel beds on the Blue Lead to the bed-rock. On the other side of the river, at North Bloomfield, they are running a tunnel nine thonsand feet in length to reach their hasin. Why dou't some of your San Francisco capitalists look at this side? They are fortunes in it. The outer and more shallow deposits have been rich. The bars below this point on the river heve also been very rich. All the evidences of a chennel are here in the washed boulders, the old blackened and petrified trees lying in the course of the lead, and in every direction. Water by the thonsands of inches is running to waste in the river, which ought to be crumbling down the banks. Somebody will ssek it after awhile. Bnt onr gold mines are not the only onee which promise well.

Iron Mines.

We have immense iron mines, or mouuteins, and will probably at some future day furnish all of thet metal required for use on this coest. I remember thet, in 1856, just before the great fire of thet year, which laid this city in ashes, one of our old citizens brought in about a ton and a helf of ore to be smelted at Coker's, which was the perent of our present Nevada Foundry. The fire rendered that fruitless for the time. Letely another party has discovered an immense deposit about three miles from this city. It is said to be 70 per cent. pure iron, the croppings 100 feet wide, and it is found on both sides of the hill which containe it. Wood and water are plenty, and limestone ie within convenient distance. Now, why should we not have our furnaces and rolling-mills—make our own neils end rails, eupply the coast, and become the Pittsburgh of the Pacific? I send you a sample of the ore. Shortly a car-load is to be eent to your city for testing. This kind of black diamond won't stand "salting."

Our Copper Mines

Are again receiving some attention, and, if the operations now beiug cerried on under the direction of G. F. Destken, a practicel mstallnrgist, provs successful, we shell have a rsvival of that business.

Quertz operations ere ective, end ths work is plenty at good wages for skilled workmsn.

Kern County Mineral Vein System.

The mineral belt, cerrying ths systsm of veins here, says the Havilah *Miner*, pnrsues a north-west and southsast direction. It is about forty miles wide and seventy miles long, the town of Hevileh being handsomely located neer its csnter. (Thers ars many othsr miues in the county situeted in smellsr bslts which bound it on the east nsar Sagelend and on the west et White River.) Within our aree the bnlk of the more extensively developed mines are located. The entire belt ie cut and ribbed with goldbearing veins which cut its course diagonally, running generally in an easterly direction; but occasionelly veering off at a direct angle to the uorth and south. The vein matter is principally quertz; very little foreign rock being discovered in it. Its walls are always grenite or slate. The vein ledges, though almost inveriably well walled, are not massive, but in keeping with the general average width of all gold beering ledges on the coast, varying from two and a helf to six and ten feet. (The Big Blue lode et Kernville is between 60 and 70 feet thick.) They pitch at angles of 35 to 85 degrees.

The mineral belt to the west of Havilah commences et White River, running from Tulere into Kern couuty, ranging from there to Long Tom mining district, thence east to Delonega mining district; skipping a few miles over en unprospected conntry brings us to the once famous Keyesville mining district which was abendoned some years ago in consequence of the old cause—bad menagement and inexperience. A few miles to the right of Keyesville is Kernville which has now all of its stemps in operation on rock of a very rich grade. Crossing Kern river to the Havilah side the mines in this large belt continue, the first miniug district being the Washington, which includes Havileh with its nnmerous mines, and extends south to Caliente miuing district, a distauce of thirty miles. The leads mostly run eest and west in this portion of the belt. Next to this come Erskine Creek, where the lodes do not seem to obey any rule but run at random in network style. The lodes of the newly discovered miues—Grizzly Mouutein District—run almost directly north and sonth. In Pi Ute, Sageland and Cleraville districts the ledges run nearly east and west, verying slightly toward the north aud sonth occesionly. The most of the rock iu this district is of the best high grade ore, end turns out under the stemps $20 to $38 per ton. For the number of tons of ore crushed here, we can truthfully sey thet no camp on the coast has ever averaged as many dollars per ton as Havileh.

Oregon Mines.

The Discovery of Coal

On the South Fork of the Santiam, about eight miles above the town of Lebenon, in a spur of the Cascade renge, is a matter of great importance to the material interests of the country, and to all the present and ulterior objects of the Canal corporation. A company has been organized to work the mine called the Oregon Beaver Coel mine, of which Ex-Governor D. W. Ballard, of Idaho, now living at Lebenon, is the President. Abont fifteen tons have been taken out of the mine and tested in a variety of ways. The coal is well adepted for blacksmiths, furneces, grates and for meking gas. I saw it tested by Frank Wood, one of the most intelligent mechanics in Albeny, in the presence of C. P. Burkhart. There is no donbt of plenty of coel in this district; all that is wented to make it au extensive and profitable industry, is capital and skill; both will be forthcoming in due time. James Lindley has discovered another mine, in the seme spnr of the Cascedes, that promises to be eqnally rich end valuable. The coal of both the mines partske of the anthreeite and bituminons properties—the latter predominating.

Minerals in Ihe Cascades.

There is not the least douht but thet the Cascade renge of mounteins, and their numerous spurs, will prove one day, not far distant, a mine of wealth, consisting of coal, iron, lead, coppsr, silver and gold. Lead and copper mines are now heing worked on the Sentiam that yield 80 per cent. of pure metals. The railroads, canals and other enterprises, being built and in comtemplation, are the precursors of a grand futnre for the developmeut of the resonrces of Oregon, thet cennot now be valued or estimated.—*Cor. Bulletin.*

Idaho Mine.—The Grass Valley *Union*, of the 11th speaks of two gold bricks from the Ideho mine, which together weighed abont $16,000. They were taken from the amalgamators after a run of six days. The six deys of the week before gave over $12,000, or $28,000 for twelve days' run. The batteries were not cleaned up. The Idaho will have an interesting annnal report this year.

Indian Relics.—Seye a Selt Lake dispatch of December 12th: Major Powell, the explorer, arrived from Arizoua and reporte that an expedition has been organized, of great interest and scientific value, in regard to the mythology of the Ute Indians. Many relics of extinct racee and civilization have been discovered.

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS,
SAN FRANCISCO, November 25, 1871.

SEALED PROPOSALS FOR FURNISHING CERtain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;
Stone for Facing of Basement Story and Building the same in the Walls, etc;
Rolled Iron Joists;
Iron Girders and Columns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc;
Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposals can be had on application to the Secretary, and the Plans and Drawings can be seen, and all further information—as to the details of the work, etc.—can be obtained from the Architect, at the office of the Board.

The Bids must be endorsed for the Material proposed to be furnished or Work done, and addressed to the Secrstary of the Board.

No Bids will be entertained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or bond with twe good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the dne entering into the contract of the party to whom it may be awarded, or to be forfeited, if the party fail to enter into the said contract.

Each bidder for Brick will state what quantity he will furnish within one year, and at what times he will deliver them. Samples must accompany each bid.

The Board reserve the right to reject any or all bids.

Payments will be made monthly in "City Hall Warrants," of 75 per cent. of ostimated amounts due, and the remainiug 25 per cent. when the contract is completed.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioncrs.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constautly received and transperted into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We havo been awarded succesively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRIOULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER.
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full descriptlon of thia Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

FRED. KRAJEWSKI,
MANUFACTURER OF TOOLS
—FOR—
Molding, Turning, Carving, Etc.
Mortise Chisels, Blind Chisels, Crotchet Chisels, and also all kinds of Screws for Stair Work and Sash Joints on hand and made to order.
Berry etreet, bet. Fourth and Fifth, SAN FRANCISCO.

Important to Miners and Mill Men.
Silvsr-Platsd Copper Amalgamating Plates, for Saving Gold.
Of all aizes and in any quantity, furnished to order. Full instructions sent for operating.
Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.
SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Miesion street, San Francisco.
2v25-3m E. G. DENNISTON, Proprietor.

Magnesium Limestone, Magnesite, Carbonate of Magnesia, Porcelain Earth, Etc.
Persons desirous of contracting for a supply of the above article, or knowing where it can be readily obtained, will confer a favor by addressing
GEO. G. W. MORGAN,
742 Harrison street, San Francieco.
P. S.—The article wanted is known nnder the several names heading this adv. It is a peculiarly white and hard aubstance, infusible, looks like chalk, but ecratches wood instead of marking it. de14-1m

Patent Ore Bags—A New Article.
These bags, by virtue of a patent lining, provent ore siftings, and are the most durable bags used.
For sale by A. GERBERDING,
22v25 318 Front Street, Room 10. S. F.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Opsratss as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as befors. Thus it is constantly passing a regular flow between the grinding surfaces and lute the quicksilver, until the ors is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO
We would call the special attention of Assayers Chemists, Mining Companies, Milling Companies Prospectors, etc., to our large and well adapted stock o
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furuishing these supplies since the first discovery of mines on the Pacific Coast.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent free upon application.
7v25-tf JOHN TAYLOR & CO.

To Mill Men and Miners.
I am now manufacturing
CYANIDE OF POTASSIUM,
Which I can sell upon better terms than any other dealer on the Pacific Coast.
I make three grades or qualities to suit the requirements of different consumers.
I will be glad to furnish prices to any person addressing me on the subject.

San Francieco.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcesterehire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

L. SCHUMANN,
PIONEER
Meerschaum Pipe Manufacturer,

No. 341 KEARNY STREET,
Between Bush and Pine streets, San Francisco
The first and only Manufactory on the Pacific Coast. MEERSCHAUMS MOUNTED WITH SILVER. Meerschaum Pipes Boiled and Repaired. Amber Mouth-pieces Fitted.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[Reported Officially for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Dec. 17th, 1872.

For Week Ending December 3d, 1872.*

Animal Trap.—Henry J. Baddeley, Napa, Cal.

Dumping Cart.—George Zoanny, Napa, Cal.

Speaking Tubes. — Frederick A. Well and Julius Finck, S. F., Cal.

Coffee-pot.—Martin Hofman, S. F., Cal.

Grain Separator.—Jeremiah B. King and Orrait Cronkite, Sacramento, Cal.

Harrow.—Andrew W. Bohaker, Napa, Cal.

———*The patents are not ready for delivery by the Patent Office until some 14 daye after the date of issue.

Note.—Coplce of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Incorporations.

Red Branch M. Co.—Dec. 14. Location: Forest Township, Sierra county, California. Capital stock, $220,000 in 22,000 shares. Trustees—Frank Mahon, Jas. Daly, Daniel Sweeney, M. Cooney, W. V. Gaffey, Charles Donnel and Thomae Kerns.

Oriental M. and Tunnel Co.—Dec. 14. Location: Nevada. Capital stock, $3,000,000 in 30,000 shares. Trustees—A Whitney, J. Clem Uhler, Wm. H. Ashton, Samuel Purdy and George Helm.

Cor G. M. Co.—Dec. 16. Location: Grass Valley District, Nevada county, Cal. Capital stock, $3,000,000. Trustees—J. H. Stevens, C. L. Tuttle, G. A. Treadwell, William Blandlng and Joseph Trench.

California S. M. Co.—Dec. 16. Location: Storey county, Nevada. Capital stock, $5,000,000 in 50,000 shares. Trustees—A. K. P. Harmon, W. E. Dean, A Dohle, Robert Sherwood and Martin White.

Asphalt Paving Co.—Dec. 16. Objects: Paving streets and sidewalks with stone, concrete and asphaltum, and quarrying and sellling stone for building purposes. Capital stock, $500,000. Trustees—Frank M. Brown, Ahner Dohle, J. S. Emory, W. A. Goodyear, J. T. Hoyt, C. T. H. Palmer, George C. Potter, S. R. Throckmorton and Watson Webb.

Plumas Tunnel Co.—Dec. 17. Location: Lassen county, Cal. Capital stock, $3,000,000 in 30,000 shares. Trustees—S. Heydenfeldt, James McLaughlin, D. T. Bagley, L. Leavitt and Thomas Reilley.

Pacific Tobacco Manufacturing Co.—Dec. 16. Object: To cultivate and manufacture tobacco. Capital stock, $500,000 in 5,000 shares. Trustees—J. W. Stow, J. D. Culp, Tiburcio Parrott, W. W. Montague and Wm. M. Hoover.

Banner Cons. G. and S. M. Co.—Dec. 18. Location: Diamond Mining District, White Pine county, Nevada, and in California. Capital stock, $5,000,000 in 50,000 shares. Trustees—P. H. Wells, W. Codington, Jamaa Edwards, John Bamber and James Dunn.

McElroy Gravel M. Co.—Dec. 18. Location: Oalaveras county Cal. Capital stock, $2,500,000 in 50,000 shares. Trustees—James McElroy, T. B. Beach, S. A. Chapin, Stephen Hutchinson and H. C. Lille.

The Sidney Brooks Tunnel and Lode Compauy have filed a certificate of the increase of their capital stock from $500,000 to $2,000,000.

Meetings and Elections.

Pioche Phœnix M. Co.—Dec. 16. Trustees—Robert Sherwood (President), C. W. Fox, G. W. Beaver, John McGarvey and Edward Donohue. Secretary, O. E. Elliott; D. Hardy, Superintendent.

Charter Oak Cons. M. Co.—Dec. 16. Trustees—A. K. Grim, J. P. Hutchinson and Jos. L. King. Secretary, C. W. R. King.

Hope Cons. M. Co.—Dec. 16. Trustees—Wm. R. Wheaton (President), Geo. W. Beaver, J. D. Fry, A. G. Ahell and Jos. S. Paxson (Secretary).

Empire M. and M. Co.—Dec. 18. Trustees—Robert Sherwood (President), E. J. Baldwin, J. W. Coleman, Oamille Martin and A. Goldsmith. Secretary, Geo. R. Spinney; Superintendent, A. Borland.

The Ophir annual election was held on the 18th Inst., and resulted in the re-appointment of the old Board.

Empire Mill and Mining Company.

The report of W. E. Dean, retiring Secretary of the Empire Mill and Mining Company, furnishee the following financial exhibit of the operations of that Company for the paat fiscal year:

DISBURSMENTS.

Indebtedness, per previous report	$10,012
New shaft	58,415
Installment on machlnery for new shaft	5,000
Expense account	4,205
Interest account	1,894
Imperial quota for October and November	3,996
Mine expenses	242
Legal expenses	400
Miscellaneous	141
Total	$84,305

RECEIPTS.

Assessment No. 8	$7,290
Assessment No. 9	25,000
Assessment No. 10	50,000
Miscellaneous	2,015
Total	$84,305

The Engine Manufacturing Company, of Connecticut, will commence at once the erection, at Hnntington, Indiana, of the largest car and car-wheel factory in the West. The first buildlng will be over 400 feet long, and the works will require 1,000 men to operate them.

Coal.—A coal mine haa been found in Tehama county, the vein in which is eight feet wide.

A new steamer has been commenced for the Willamette River Tranaportation Company.

Mining in Tuolnmne conty is hindered by the want of water.

The Greatest Need of Our Mining Districts.

Go ask the first man you meet in one of our mining camps, says the Schell Creek *Prospect*, what is his opinion of the District—if it has any real merit. "Merit? plenty of it! ae good ledges as can he found anywhere in the State; every claim isn't a ledge; but a numher of very good ledgee are well known in the District."

That will he about his answer. Ask him how it is, then, that these meritorions ledges are not developed—what keeps the District back, after having started out with so good a name, at home and abroad. What is needed? "Capital!" will be hie anewer; "All the District needs, to bring it up to equal any in the State, is capital."

This conjured np ghoet of unobtainable capital is the nightmare eitting on the breast of eleeping enterpriee. The waste of time, in waiting; the waete of mnscle and food in prospecting—while already little mounde dot the hillsides with the same names ae if certain men had died and been buried in a thonsand places; the waste of writing material and bad English and express envelopes; the waste of conscience in straining a point in favor of an undeveloped fact; these, properly turned to account, would afford capital.

It is seen every now and then, that the few men who industriously set about opening their mine, and working it, if possible, for the actual metal in it, instead of conniving, for the gold notes in somebody's safe, are the men who succeed in bringing their mine to a market. "If your foot is pretty, show it;" if your mine ie rich make people see it. If you want to make somebody believe that your croppings lead down to a broad body of good ore, show them that yon believe it—by sinking between the walls. Wares which go begging in the market are apt to he slighted by money bags. "Good wine needs no hush."

In California, along in the foothills, men are to-day at work, who have been working in the same tunnel for five yeare. We have known cases where they worked a longer time—running for a gravel deposit which they had no certain clue nor guide to, but which they went for in dead earnest, seeing with the eye of faith. These men had no capital to commence upon. They would work awhile, then turn out and work somewhere for wages, till they had food enough ahead to etand another siege. Sometimea one partner would work for wages, while four kept continually iu the tunnel. Year after year they would keep on, until, reaching a certain distance, they etruck the long aought prize, or found that the pursuit had been fruitleaa, and all those years and blows were wasted.

Sometimes these men make—they are atill at it—handsome fortunee. In aome casee, after taking out an abnndance, they aell the claim to capitaliats. But we do not know of a case where one of these men ever make a magnificent fortune by making a tunnel location, pointing toward the Blue Gravel, and then sitting down and waiting for capital.

Great Successes in Ore Smelting.

It is with a great deal of pride says the Salt Lake *Tribune*, that we point to any successful enterprise inangurated here which tends to enhance onr bnainesa prospects by inviting capital to invest in our mining property, real estate or commeicial speculations.

Soarcely more than a year ago there were not lacking people here and even men ofexperience too, who, judging from the developments at that date, regarded the permanency of Utah minea as something by no means assured, and if they did not speak in absolute disparagement of the future, yet their tone wae anything hut that of an aasuring or positive character. Since that time, however, ao numerous and ao rapid have been the developmenta in various camps, that capital has been invested in numerous emelting works which in time have been followed by separating and refining works probably equal to anything of the kind in the world for the amount of capital invested. We allude to the Germania Works near this city.

Yeterday we learned some intereating facts relative to these works and the Saturn Smelting Works near Sandy, under the supervision and management of G. M. Gerriah, Esq., which we regard aa being of more than ordinary interest, inasmnch as they beepeak much for the coming year'e operationa in our Territory.

For the week ending last Snnday morning the Saturn worke produced one hnndred and aeven and a-half tons of bullion, and for the ten days prior to that run, one hundred and forty-two tona were the result, the average value of the bullion being 160 ounces of silver to the ton. Such runa as these have never been eqnaled in the Territory. The Satnrn Co. has lately sold over 400 tons of hullion to the Germania Refining Works, whioh have heen in auch active and auccessful operation that 40 tons a day of the hullion have been separated, and is said by the superintendent to he, in point of ease of separation, far superior to the hullion of Spain, France and Germany.

The Germania Co., by their peculiar process of aeparation, is said to he producing the only really pure metallio lead in the United States, and in conseqnence of thie have already received ordere from the Eaet for all the lead they prodnce. to be nsed there in the manufactnre of white lead, which naturally suggests the query, why not export the white lead at once from Utah?

It is gratifying to chronicle the great success of two such important enterprises, and the thanks and good will of our entire community are due to the energetic gentlemen hy whose experience and business capabilities the preeent results have been achieved.

How Deep Can we Mine?

Since the exhaustion of the English coalfields is an accepted fact, within the compass of three centuries at least, and since the present cost of coal-mining is already affecting the price of iron in all the markets of the world, a few statements in regard to the difficnlty of procnring coal at greater depths than those now reached will be of interest. At a depth of 50 ft. helow the snrface of the earth there is a zone of equable temperature, where the thermometer marks 50°. Observation ehows that this temperature increases at the uniform rate of one degree for every 55 ft. So, at the depth of 1,760 ft. the temperature is about 78°. One mine in England, 1,640 ft. deep, is already worked to a great disadvantage, owing to the failure of the miners to endure the steady heat. In the colliery the shaft is 2,376 ft. deep, and the temperatnre is 98 degress or hlood-heat, and their prolonged labor is impossible. The limit of profitahle mining is therefore about 1,700 ft., and at 2,700 ft. mining is impracticable. At the depth of 4,000 ft. the temperature wonld be 122°, and at 10,000 ft. it would be at the boiling point, if not even higher, as it is possible that the rate accelerates as the descent is made. It is curious to note the Commission of sixteen eminent men of science which was appointed to ascertain how much coal conld be raised from seams already worked, and how much from measures yet untouched, stated, that at the preseut rate of consumption there was a supply of coal in Great Britain for 1,273 yeare, but at the ratio of increase the snpply would not last 276 years. Our figures show that coal cannot be mined at a depth of 4,000 ft., and at 2,700 ft., the limit of physical endurance is about reached. Of course, then, the vast area of coal below that depth, and, indeed, below 1,700 ft., where miners are forced to work shorter hours, and where the temperatnre ia nearly 80°, must remain nntouched. The Commisaionera hardly dared look the situation in the face, and their report in reality is little better that a juggle. Already nearly all the coal above the depth of 1,700 ft. has been raieed, and that below can only be reached at a cost not pleasant to contemplate. The *British Quarterly* estimatea the quantity of that in the next 1,000 ft. at 39,000,000,000 tone, and that in the next 1,000 ft. at 22,000,000,000, and at preaent ratea of increase, the last ton of the 39,000,000,000 will be raised in 1945—and then ont goes Great Britain.

California.—Here is a picture of our great State, from the Eureka, Nev., *Sentinel:* "Was there ever such a conntry before as California? She ia an empire in herself. Were tbe State moved into the sea, there would be nothing needed hy her people but to develop her great and diversified resources. Her wheat crop this year will reach 30,000,000 bushels, and yet her wheat-producing area is not one-fourth appropriated. Her fruits supply the whole Coaat, except Oregon; the East begine to look to her for wines; her wool clip is enormous, and there is growing up within her limite the finest stock of horses and cattle in the world. Yet her population is not 600,000, and not a decade haa passed aince any pretensions were made in regard to California as a great agricultural State. She is not half appreciated yet. Were all the people of the United States congregated within her horders, she would austain them all better than France can provide for her thronging millions. Look at her ship exports; gold, wool, wheat, fruit, wine, and these in no atinted quantities, but by the millions, for her people do nothing small. What a future is in atore for the Golden State, when her thousands of people increase to millions; when her waters are turned into canals to feed the thirsty plaina; when her foothills are covered with vineyards; when all the trade of the mighty, myeterious Eaat is disseminated by half a dozen transcontinental railroade through the Union and to the world beyond. California is a constant study and a constant surprise."

The Virginia Gold Field.—Some montha ago a company of Northern capitalists went to Virginia and quietly hought up large tracts of land, over 2,000 acres, in Spottsylvania county, twenty miles from Fredericksburg, intending to reopen the abandoned gold minea. These mines had been worked by various parties for twenty years, but without profit, not because the preciona metal could not be found in paying quantities, but because the ore was of a character to defy all known methods of treatment. The new company have purchaaed a patent from Prof. Crosby, of Maiue, who apent several years in the mines in Colorado, and succeeded in perfectiog a system for the reduction of all kinds of gold ore at a merely nominal cost, and which he warrants to eave eighty per cent. of the mint assay of orea, the ordinary percentage being about twenty-five. The company have now in operation one of these mills, with a capacity of twenty tons per day, at a cost of about three dollara per ton. They intend to deepen their present ahafts and open others, and introduce machiuery to work them to their full production.

The Pacific Mail Company's Bad Luck.—During the past six months the Pacific Mail Company have suffered a great deal by the loss of some of their steamers and serious accidents to others. The *Oregonian* got on a reef several months ago in the inland sea off Japan, and was badly damaged. Then followed the burning and total loss of the *America* at Yokohama. Then the *Bienville* was lost on the Atlsntic side, and while the *Rising Star* was being prepared to take her place she slipped from the dock and was badly damaged. The *Guatemala* was lost in passing through the Gulf of Tehnantepec and a number of lives were lost. On this side, the *Arizona* and *Constitution* recently met with accidents to their machinery and were badly damaged. Then the *Orizaba* hroke her shaft, and the loss of the *Sacramento*. last week ends the list.

The San Rafael Mines.—I noticed a large lot of provisions and other goods going from Pauley's, McDonalde and Steiner & Klauber's stores to the mines of San Rafael, in Lower California, lately, and, on inquiring, learned that the goods went for Mendelson, Power and other tradere in San Rafael, and that hnsiness, in spite of the protracted drynese, ie improving. The mines are proving rich, and by the "poco a poco" process of a Mexican arastra, a good deal of gold is being got out. How the poor people get a living there at the pricee of the necesearies of life is almost a mystery, and would be qnite so with any people but Mexicans. Flour, $16 a barrel; sugar, 25 cents a pound; and coffee 37½ cents. Everything else in proportion. Since vessels under fifty tons measurement cannot take goods to Ensenada, which is the nearest port to the mines, everything to live on there but beef goes from San Rafael in wagons or on pack animals, costing for freight alone about four cents a pond. All is peace and quiet below onr Southern line.—*Cor. Bulletin.*

In Westphalia, Germany, three large iron companies have combined themselves into one association, whieh is perhaps the greatest connected with the iron trade in the world. The annual production of the works which it controls is 20,000 tons of steel, and 250,000 tone of iron in various forms—pigs, raile, etc.

Potteries.—California has six potteries, of which two are at Sacramento, one at Oakland and one at Antioch. They are engaged at preaent in making articlea of Rockingbam, yellow and earthenware, sewer pipe, red crockery, flower pots and fire brick, hut one of the Sacramento establishments will soon commence to burn terra cotta.

The quartz mines of Calaveras connty are said to be paying well.

Leather Market Report.

[Reported for the Press by Dolliver & Co.]

San Francisco, Thursday, Dec. 19, 1872.

Shipments of Sole Leather to the East are quite heavy, and prtces are firm, though there has been no advance. Domestic Calf Skin has advanced 10 per cent., in consequence of the large amount destroyed, and French Skins are firm with an upward tendency.

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of Intermittent and Marsh Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form th medicinal effects of the leaves of Eucalyptus Globulu

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries,

No. 521 Montgomery St., hetwwen Clay and Commercial, San Francisco. no28

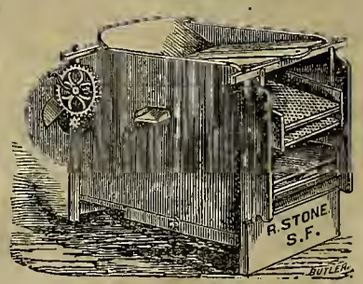
THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

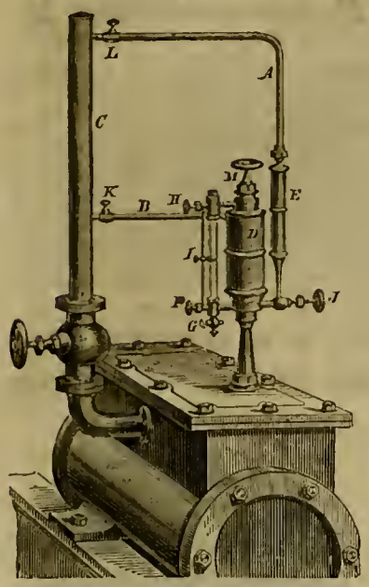
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

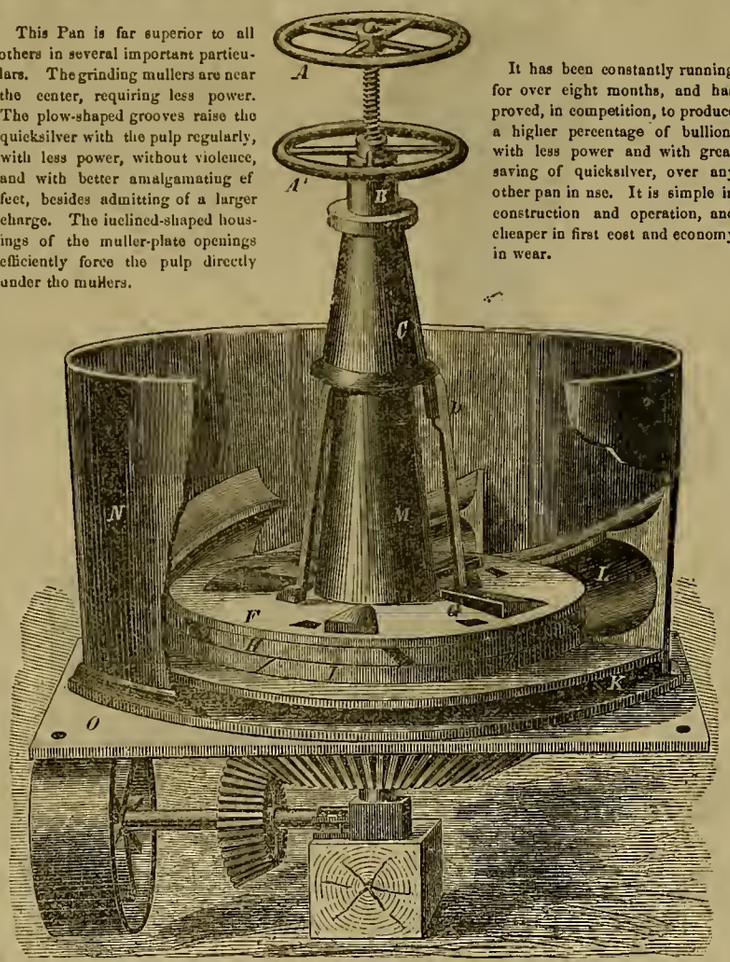
FROISETH, Publisher, Salt Lake City, Utah. 10v25-tf

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

Building Fronts, Water Pipe

Sinks, Monuments, Fountains,

Tiles, Copings for Walls,

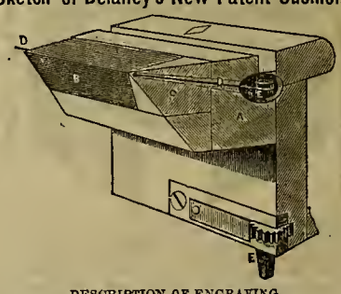
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

OFFICE, No. 10 BUSH STREET, San Francisco.

Sketch of Delaney's New Patent Cushion.



DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire, tending from pin into and through rubber cushion; B, rubber cushion; C, is end of rubber cushion; A, lining.

Their construction is of the simplest kind, thus making no heavy expense for suppositous elaboration. The improvement is a steel wire running lengthwise, and communicating with a pin at each end and inside of the rails; the wire is imbedded in the rubber cushion near its edge or surface. The pin mentioned is controlled and operated upon by a key, regulating the tension of the wire, according to the necessities of the case. It keeps the edge of the cushion straight and sharp. It prevents the rubber hardening from the impingement of the ball, and, above all other considerations, the angles are bound to be perfectly correct.

The ball never jumps from the table, however severe the stroke. It makes no noise when leaving the cushion.

Nine cushions are made upon our tables with the same degree of force requisite to make six upon any other.

These unrivalled cushions are self-protective, and will retain their elasticity either in hot, cold, dry, or damp weather, almost forever.

Thousands of Delaney's cushions have been introduced throughout California and the Great West, where the largest billiard manufacturers now make exclusive use of them, to the eminent satisfaction of their patrons.

Sole Agents for the Pacific States, China, Japan, Sandwich Islands, and Australia.

24v22-3m JOSEPH MOORE, Superintendent.

THE Salt Lake *Tribune*, a leading Utah journal, which takes great interest in mining matters, endorses our correspondent, Col. B. A. M. Froiseth, and the MINING AND SCIENTIFIC PRESS, as follows; "The mining population of Utah are much indebted to Colonel B. A. M. Froiseth for his representation of the Utah mines in foreign and home journals. A few days ago we noticed an elaborate and truthful letter in the *London Mining Journal*, and still more recently the miners of Camp Floyd have reason to thank him for a carefully prepared map of that district which appeared in the MINING AND SCIENTIFIC PRESS, of San Francisco, together with a letter, a column in length, eulogistic of that district. Colonel Froiseth is doing a good work in presenting the mineral resources of Utah abroad, and, as he is a gentleman of undoubted ability and veracity, his communications are of great value to the mining interests of this Territory. We understand the Colonel has a number of copies of the MINING AND SCIENTIFIC PRESS containing the map alluded to; and parties interested in Camp Floyd would be subserving their own interests by not only securing a copy containing this map, but by subscribing for the PRESS, as it takes a lively interest in mining matters pertaining to Utah."

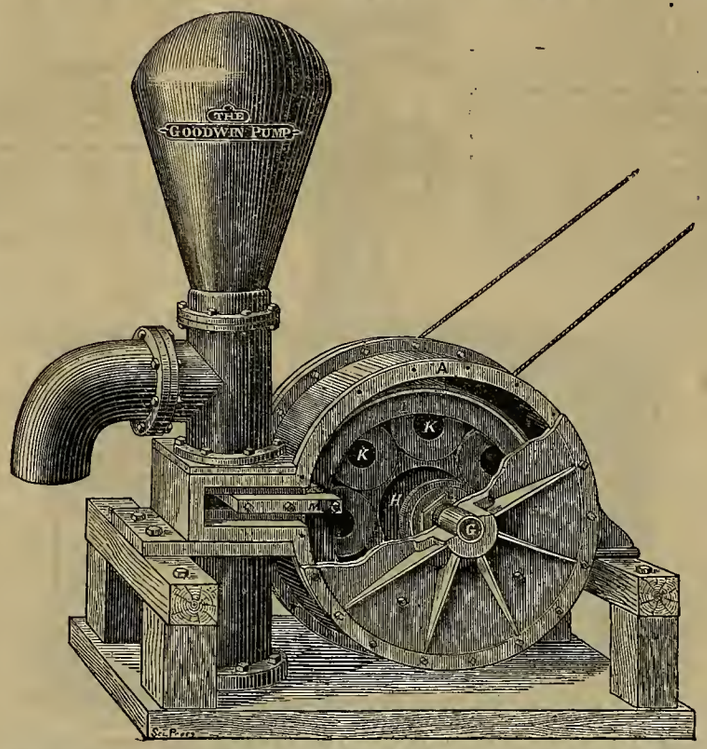
THE GOODWIN PUMP.



This Pump, which was awarded the PREMIUM at the last State Fair, where a large number of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.

We are rapidly increasing our Patterns and extending our facilities for manufacturing, but have not yet been able to fully supply the demand. As our Pump has no valves, it is the best Pump for mines where water containing sand or sediment, or where hot liquids have to be pumped.

It is Unsurpassed for Hydraulic Mining,

And will throw a stream of from two to six hundred inches of water with a force equal to a fall of two hundred and fifty feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

PUMPS FOR EVERY PURPOSE AND ALL CAPACITIES,

MANUFACTURED BY

GOODWIN & WEST,

No. 235 FIRST STREET, ... San Francisco (Miner's Foundry).

ALL WORK GUARANTEED.

Send for an Illustrated Circular. 16v25-sa

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

SAN FRANCISCO, SATURDAY, DECEMBER 28, 1872.

VOLUME XXV. Number 26.

Improved Vapor Burner for Warming Rooms.

We give herewith a small illustration of an improved vapor burning stove, designed for warming offices, and other small rooms, where but little heat is required. As will be seen by the accompanying engraving these stoves consist of a body or drum within which is the heating apparatus, and above which is a reservoir for the gasoline, from which the liquid is readily and safely fed to the burning apparatus within the body of the stove.

The improvement, which is the invention of Mr. William Frisl, of this city, consists in the employment of a peculiar dish or bent plate, which is fixed to the generator attached to the heating apparatus, but which is not shown in the engraving. The object of this dish attachment is to so spread the flame as to obtain from the same the greatest possible heating power. This stove may also be used for cooking purposes, and will be found very serviceable and convenient for other uses.

MINING LAWS IN ENGLAND.—A new mining law has recently gone into effect in England among the provisions of which is a system for securing the competency of managers; another lays down certain general rules for the prevention of accidents; a third provides that an amount of ventilation shall be produced in every mine sufficient to dilute the noxious gases; a fourth establishes a board of inspectors to see that the various provisions are carried out. It is further provided that the mines shall be inspected at least once in twenty-four hours, and regular reports made. Some provisions of this kind might be advantageously incorporated into the mining laws of this country.

ANOTHER CHINESE WALL.—Quite a romantic piece of news comes from Cuba. It is said that the legitimate authorities appear to have despaired of being able to "crush out" the rebellion have decided upon erecting a (stockade) wall 15 feet high and 60 miles long from shore to shore, across the island, in imitation of the Great Wall of China. A block-house is to be established at intervals of a thousand yards and a redoubt in each interval. These preparations, with military camps every three miles, a railway, telegraph and 5,000 troops along the line, it is thought, will keep the rebels in check—perhaps so.

DIAMONDS.—The idea of finding diamonds in Arizona and Colorado is not yet fully given up. Arrangements are still in progress to start out prospectors as soon as the spring opens.

EAR Trumpets of a wonderful construction, by which it is said ordinary sounds can be heard at a distance of a mile, are to be exhibited at the Vienna Exposition.

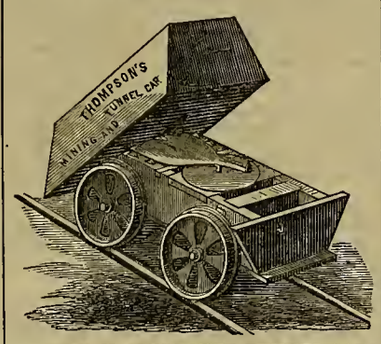
Automatic Dumping Car.

One of the great drawbacks to the use of dump cars, which deposit their loads by the tipping of the car bed, is found in the fact that the bed must be placed with its central line at a sufficient height above the track to permit it to turn or tip to an angle sufficient to relieve it of its load, thus rendering the car inconvenient on account of its height.

To remedy this defect, Mr. James M. Thompson, of Quincy, Plumas County, has patented (Sept. 24, 1870) a device by which the bed, instead of having to tip from a fixed position, and pivot from a central point between the wheels, may, by a simple and easily-worked device, be readily pushed backwards and tipped from the rear of the truck, at a much lower elevation than if it had to be tipped from a fixed pivot—the car, so tipped, is shown in the engraving.

In addition to this advantage, the same device admits of the bed being revolved one-quarter round, either way, so as to dump its load upon either side of the track—a matter which is often of much advantage.

After the bed has been relieved of its load it



THOMPSON'S IMPROVED TUNNEL CAR.

can be easily elevated and replaced on the truck by means of levers, or otherwise, a rack and pinion between the body and truck, permitting it to move easily back to its place. As a mining car and for blasting on railroads, this car will be especially useful, and much more convenient than the high dump cars generally in use. This patent, as well as a number of others, has been obtained for Mr. Thompson through the SCIENTIFIC PRESS PATENT AGENCY.

Japanese Minerals and Mining.

We have had the pleasure of examining quite an extensive and interesting collection of minerals which have been on exhibition for some days at No. 1015, Market street. This collection has been made by Prof. Jacques Kaderly, late professor at the Imperial Academy at Yeddo. Much of it was secured while acting in his professional capacity, but the chief portion during a year of leisure in which he visited all accessible parts of the Empire. The exhibition here made fully satisfies the representations which have been given of the great and varied mineral wealth of Japan.

Of the precious metals we have silver and gold in all the forms which the ores of those metals usually present. Prof. Kaderly informs us that there are numerous gold mines there, two only of which are worked systematically. These are both being worked under the direction of an English engineer, the ordinary stamp mill being employed for the reduction of the ore. Placer gold is frequently brought in for sale to the English traders, from various quarters, but the Japanese maintain the strictest secrecy before foreigners with regard to the localities where it is found.

Some very fine samples of copper are also exhibited—sulphurets, carbonates, oxides, etc. The copper mines are said to be very extensive, and have been worked for centuries. Copper is an article of export from Japan. Several silver, lead and copper mines are worked in the provinces of Kango, under the direction of a French engineer. These mines are located at intervals of four or five miles apart. All the mines in Japan are worked in the interest of the government—no concessions being made either to foreigners or their own people. Foreign skill in supervision is recognized as more profitable to the government than native.

Iron ores of various descriptions and of very superior qualities are also exhibited by the Professor, who informs us that numerous iron mines are worked, and have been for ages. The Japanese employ the same small furnaces which have been used from time immemorial in India. The furnaces have a capacity for only 15, 20 or 30 pounds of iron. Only the most choice ores are worked, the iron turned out being in a malleable condition. Of late, however, two large furnaces have been erected—one each under the direction of an English and an American engineer, which are now turning out pig iron on a large scale. The government is evidently becoming aware of the importance of its iron interest, and will doubtless eventually be able to turn out iron on the largest scale, and by the use of converting furnaces and rolling mills work it up cheaply into all the various forms requisite for commercial purposes, whether for machinery or railroads.

Cinnabar is also shown in very rich samples. It is only lately, however, that this mineral has been discovered, and it has not yet been worked.

Antimony and bismuth are shown, and are said to occur in great abundance. The Professor also exhibits some very fine specimens of tin ore. This metal is abundant, but as yet has been worked only in a very primitive form and by natives. The home demand has never yet been fully supplied, although this metal might, no doubt, be made a matter of export.

Sulphur is found in inexhaustible quantities about thirty miles from Yokohama and upon the slopes of the extinct volcano of Fuzi-Yama. Fine samples are shown.

Alum also occurs in inexhaustible quantity. It is worked by the natives and exported in considerable quantity. We were also shown several small but very fine specimens of lithographic stone.

Among the more rare minerals and precious stones the Professor exhibits quite a collection of agates, onyx, cornelian, rubies, garnets, amethysts, chalcedony, etc., all of which are said to be found in large quantities. We noticed in the collection a large and very fine show of quartz crystals, varying from those which were perfectly limpid, all the way through the various shades of "smokiness," to perfect blackness. One of the larger translucent crystals enclosed a quantity of water—a very rare occurrence.

Some very fine specimens of amber were also shown, which we are informed is often found upon the sea-shore in certain localities. A fine show is made of variegated marble; also of numerous other minerals, such as jasper, serpentine, tourmaline, lavas, etc.

The only specimens of a carboniferous character which we noticed were some fine massive specimens of jet. It is well known, however, that coal of a superior quality exists on one or more of the islands.

The Professor has also a large collection of fossils—both fauna and flora—some of which are quite interesting, especially to the geologist and paleontologist.

Coming from a country with which we are really as yet little acquainted, and yet with which we are growing familiar, and which is destined to become of great commercial importance to this city, the collection possesses an unusual degree of interest; and, as it is for sale, it should certainly find its way to the shelves of some public institution, where it may serve as the nucleus of a more extensive collection, which might be made a most interesting and profitable subject of study. We understand negotiations are in progress for its temporary deposit at Woodward's Gardens. It is to be hoped that sufficient public spirit will be manifested by some one to prevent its transfer to Europe, whither it will go, unless purchased here.

Growing Plants from Cuttings.

The question is asked us—"why is it so difficult to get plant cuttings to grow in pots, in the country or, indeed, outside of green-houses generally?" The person making the inquiry says, she uses the best garden soil; keeps the pots in a warm, sunny place, waters them abundantly and yet, the cuttings are *so slow* in starting, if indeed they start at all.

We might suggest at least three good reasons, probably, why the cuttings do not grow well. One is, that they are not taken from the parent plant at the proper time of growth; the second, that instead of "the best garden soil" they should be started in nearly clean sand; and the

third reason probably is, that the part of the cutting above the surface of the ground is kept, not perhaps too hot, but too dry.

W. Tyrone, in a valuable European exchange gives the following simple plan which may be adopted, and which will almost always insure success:

A common large cigar box may be the house. A pane of glass to cover it will make the roof. A shallow pan, or two saucers of water in the bottom of the box, or 2 inches of fresh wet moss around its roots, or both, as shown in the accompanying figure will furnish vapor which the glass covering will retain, while admitting light. To prevent access of heat in case of the sun shining full on its glass roof, a piece of white paper can be laid on as a screen, and kept secure by a piece of glass, so that light may be excluded as little as possible during the day. And if cold nights should occur, the box is easily moved to a safer position.

The engraving shows in section, three cuttings set in the sandy mould in the inner box, the pan beneath, the moss around, and the glass and paper and paper-weight above.

All necessary precautions are then secured, and a crop of cuttings may be had, rooted, in a week or two, if they are taken green from the end of the stoutest young shoots of an herbaceous plant, when just under full process of extension in growth. The lower leaves are taken off and the cuttings immediately set in the damp, sandy soil, before they fade in the least. They may be from 1 to 3 inches long, and the two or more leaves left on them may be clipped if they are very large, so as to reduce their length. The soil may be pure sand, if merely for rooting or striking the cuttings, as the phrase is. But whatever soil is used must be sweet and fresh, taken from the *surface*, where it has been long exposed to the light, the rain, and the free air.

CAUTION NEEDED IN REGARD TO THE HORSE EPIDEMIC.—The Buffalo papers state that a young man in that city, who, while taking care of a horse sick with the prevailing epidemic, received a small portion of the virus in the eye when the horse snorted, has lost the use of that eye in consequence, and will probably lose the use of the other.

A Chat About the Grass Valley of To-Day.

We give space to the following pleasant notice of an old mining town, which we find in the Marysville *Defender:* A ramhle around Grass Valley showed us many changes. The town has improved very much, though it has heen rather dull during the past summer. Some of the mines are not being worked at present, which has had the effect of throwing a number of men out of employment. Still, the progress of the town is steadily onward, and will continue so for many years to come. Grass Valley is one of the prettiest mining towns in the State, and possesses more advantages than any town we know of. The cottages are tastily huilt, surrounded with

Gardens and Orchards,

Presenting a home-like, attractive appearance. So much has been written regarding the mines of Grass Valley that we could say nothing new on the subject. We can only give a hasty glance at the place and speak of those we found there. "Old Block" still presides over the scales in his banking-house; hut little changed by time —varying his financial labors with occasional sketches of men and

Things of the Golden Time.

Spencer still lays down certain points on his crihhled arm and demonstrates their feasihility to the most skeptical. Shoemaker can be found in the sanctum, wielding pen or scissors, as occasion requires, to make a live journal. Charley Smith of the Exchange has rented his hotel, and now attends solely to the liquid business. His hair and beard grows old much faster than he does, which he attributes to the fact that they belong to another family, his father having married twice. We missed several of

The Old Familiar Faces.

Schenk Glass, genial and careless, is lying in the little cemetery, along with others whom we last met in perfect health. John R. Ridge, poet, scholar and gentleman, has also gone the way of all mankind, and it will he long ere his place in that community can he filled again. But we have little to do with the dead, let us rather deal with the living.

Grass Valley is essentially a miners' town, and Cornish at that. The stranger, on entering a hotel or restaurant, would imagine himself

Among the Old Country People,

In one of their mining towns. Sitting at breakfast {one morning in the hotel we listened to conversations like these: "Hi say, coosen Jack, how is the work looken' now?" "Oh, spara forthly, he be gone to peirch out all together, I thinks." "Say, waiter, hring me two hoiled heggs and a glass of 'arf and 'arf." The order was filled, and the miner, hreaking the eggs on the end, looked up, exclaiming, "Hi say, you waiter, do ee see this? Hit his ha' bloody swindle; these heggs are not 'arf full'." Another couple sitting hy appeared to be

Great Cronies.

One of them was a little the worse for liquor and was inclined to be noisy. His companion remonstrated with him in this wise: "Hi say, Cap'n, hif hi couldn't sit down and take a glass of grog comf't'ble, without making a blarsted fool of myself, why hi'd go whoam, so 'elp my G—d, Cap'n." But aside from the hardy, industrious class, which has given Grass Valley its wealth and prosperity, there is

Another Element Entirely Distinct.

We refer to the mine owners and business men of the city. Some of the wealthiest men in the State, like the Watts and others, have their residence here, on which have heen lavished all that wealth guided hy taste conld procnre. We know of no finer homes, no more pleasant, social aud refined people anywhere than this class of residents. Through their example the city has heen heautified and adorned, and from the rude mining hamlet of a few years since has become the prettiest and

Wealthiest Mining Town

In the State. We are not advised of the number of mills now running in and around Grass Valley, hut they are quite numerous. Many of them work solely on custom work, others work only the rock taken from the mine to which the mill helongs. It would be beyond belief to those who know nothing of the wealth of Grass Valley mines could they he informed as to how much wealth has been taken therefrom since the mines were first opened. It is

Counted by ths Millions,

And had it all heen applied to the payment of, would have gone far toward bearing the expense of the State Government since its organization. So far as we could observe we should infer that there will he but little change in the yield of gold for years to come from these mines, and that change will he for the hetter. New veins will be struck and opened, and the richest quartz helt in the State will maintain its supremacy while quartz mining exists.

The Vultures of Our Mining Interests.

In the effort to promote the development of her minaral resonrces, Utah, like all new mining countries, has encountered many difficulties and discouraging influences, not the least of which arises from the ravages, so to speak, of a certain class of men who will not allow a mine to he sold, if they can by any meane cast suepicion upon its merit, or lead the proposing purchasers to think they might do better elsewhere, unless they are paid or allowed to take a share in the profits. Hundreds of these vultures fatten upon our miners, aud thosa who operate for miners in trying to hring capital into the country that their property which most likely would otherwiee remain idle and unproductiva, may ba properly worked, and they either hy sale or a reserved interest be enahled to reap some return for the lucky chance of the discovery and their original labor. Yet in almost numberless instances, the good fortune which the miner believed was really his—which perhaps was actually "in sight," has been, for the time being at least, destroyed or stolen by creatures, who were not provided for, hy payment, to abstain from an attack of misrepresentation and falsehood. We have instances at hand where within the last four weeks some of the most promising arrangements for investment of capital in our mines—one plan including the erection of a thirty-stamp mill, have been hroken up—not from any interest or desira to secure parties from loss through hetter information or advice, but simply and solely because the "outsidars" could in no manner persuade the owners of the property to pay tributa.

In two of the cases to which we allude, the minee had heen carefully examined hy competeut men, who came out expresely for the purpose and their report was highly favorable—in fact the property they declared more valuahle than claimed to he hy the parties who offered it; the latter, however, relying upon the real worth of their mines, having turned a deaf ear to the demands of men who had no honest claim or interest in their business, the proparty fell at once under han. Insidiously tha poison worked, till bewildered, and doubtful almost of their own senses, the straugere, who would probahly have invested nearly a qnarter of a million dollars in machinery and improvemente alone, ahandoned all negotiations and left in disgust for their homes.

This is one species of "black mailing;" there are others, however, equally outrageous, some of which are exciting great indignation in this community. Men here, claiming character for honesty and fair dealing—*honorable* (?) men, are growing rich hy practices of extortion in connection with mining affaire. Their operations are reduced to a perfect system, the ramifications of which extand to all the principal cities of the East and the European capitals. Their correspondence finds its way to every nook and corner, and they themeelvee are no amateur rogues. They know the trade—it is their profession, and few, if any, who are so unfortunate as to be caught in their toils, ever escaped unharmed. Is there no remedy for these evile? Will onr miners and those interested in their development, suhmit always to ba rohhed? It ia time, we think, that something should ha dona, to abate the wrong, and thoaa who perpetrate it likewisa.—*Utah Mining Journal.*

Ophir Mining Co.—The Directors of the Ophir Mining Company met on the 19th and re-elected the old officers as follows: President, M. Castle; Secretary, Jos. Marks; Superintendent, J. C. Corey. The gross receipts for the past fiscal year have been $298,136, and the disbursements $293,343; amount of cash on hand, $16,641. No dividends have been paid during the year. The income was principally from assessments, four haying been collected, as follows:

	Per Share.	Amount.
December, 1871	$2	$39,600
April, 1872	5	84,000
July	5	84,000
October	5	84,000
Totals	$17	$235,600

Last April the stock sold for $130 and $140 per share. It is now worth ahout $40. The Directors agreed to submit a proposition to stockholders to increase the capital from $5,040,000 in 16,800 shares of $300 each to $10,080,000 in 100,800 shares of $100 each. Action will be had on the same on the 27th of January.

Gold Hunting in Colombia.

Some of our readers may remember says the *Bulletin,* that in 1866 a numher of Californians were lured to Barbacoas, on the western coast of Colombia, by reports of the existence there of rich placsr mines, which could ha cheaply workad with native lahor. Tha mines were there, sure enough, formed hy the washings of the Cordillera streams for ages; but the owners asked for one-half the product, the climate was sickly, and our adventurers, generally without means, finally ahandoned the country iu disgust. Ona of the few who ramained wae Dr. James Weaver, an old Californian, who had heen a pioneer miner and ditch builder in Nevada and Yuba counties, where a mining canal still bears his name, aud who will be widely remembered when we recall his name, both in this State and Nevada. Weaver left the coast, pushed into the interior of the province of Cauca, which is in the southwestern extremity of Colomhia, and prospected high up in one of the Audean ridges, where he had to cut a trail, and made his way with great hardship. On the hanks of tha river Aguarica, whose name indicates ite auriferous richness, he found gold wherever he washed the gravel. After many vicissitudes he estahlished himself in this lonely country, in a hut with a few Indians. But his Indians deserted him and he was obliged to quit Aguarica. At Yaculo, however, in another part of Cauca, 30 miles from Barhacoas, he found extensive placer deposits similar to the hydraulic minea of California, where one Pablo Rienel, with men, women and children, Indian and Negro, was taking out considerahle gold hy meane of ground sluicing, water heing plentiful for the purpose, and rain falling often enough to keep the grouud constantly in a good condition for washing. Weaver saw Rienel's people wash up 40 pounds of gold, weighed with the steelyards at 16 ounces to the pound. He found the mining county, consisted of high gravel ridges divided hy many ravines and streams, to he very extensive and admirahly adapted for hydraulio operations. Rienel owned 30 square leagues, which he offered to sell for $200,000—and all of it, says Weaver, is regular mining ground. Tha Yaculo diggings are known to very few people, and Rienel is the only one who has tried to work them largely. The nagro women make spending money easily by washing in the ravines. The county is very eparely inhabited. The land, whcn owned hy individuals, is held by title descended from the King of Spain. The laws allow one man a league of mining ground when found vacant, and much of it is vacant and unexplored. Dr. Weaver was eo pleased with the Yaculo country that he hae come to San Francisco to obtain the implements and machinery necessary to hydraulic miming, and means to return there to work some land he has secured. He says labor can be ohtained for $10 a month; that any kind of vegatables can be easily raised, that the climata is good, the people (mostly Spanish and Indians) are friendly, and edihles of all kinde very cheap. But he saye it ie no country for poor men. Without money and implements to work the ground syetematically on a large ecale, Americans would starve there. The Panama *Star and Herald* editorially endorsee Weaver's statements concerning the gold regione of Colombia, which are important outside of Cauca, and prints a long letter from him, decribing that interesting wild country and his adventures—which smack of Californian forty-nine experiance. But ae Weaver saye, it ie certainly no country for poor men.

Discovery in Mendocino.—A rich discovery of mineral is said to have heen made on the ranch of W. Lift, near Point Arenas, in Mendocino county. The deposits consist of coal, which has heen tested and found superior to the Mount Diablo article; of iron, and of a peculiar kind of clay, which is plastic and susceptible to a high polish. A correspondent of the Mendocino *Democrat* states that artistic ornaments are made of it hy the ladies of Mr. Tift's family. When dried and hurned, it becomes very hard and strong. A pitcher made of it dashed to the ground with considerable force did not hreak. Cold water may he poured into any vessel made of it when at a red heat, and it will not hreak. It is helieved that hrick made of this material would he of a superior quality. Several years ago mining operations, in both gold and silver, were condncted in Mendocino, and many of her mountains are believed to be rioh in this kind of wealth, if they were properly prospected. These discoveries may stimulate farther development.

Sulphur Mines.—A San Diego dispatch of the 19th says: Work in the sulphnr mines is progreseing finely. They are located twelve miles from the Colorado river, sixty miles below the frontier houndry line, near the southern end of Cocapah mountains. The sulphur is found in ledges similar to coal veins. One million tons are in sight. Experiments show 75 per cent. of pure sulphnr, which is worth in San Francisco fifty dollars per ton.

Among the narrow-gauge roads now talked of is one from Petaluma te Bloomfield and thence to San Rafael and Saucelito.

Coal Market—Discoveries Near Santa Rosa.

Our contemporary in Petaluma in a recent issue said that coal was being extensively used in that place, and was considered by consumere cheaper than wood. The price of wood is not given. If coal at $15 to $19 per ton ie cheaper, the price of wood must indeed he exorbitant. There are five mines in California and Oregon, now heing worked, from which the San Francisco market is mainly eupplied with coal for domestic uee and eteam purpoees. The yield of the largest field, the Monta Diablo, for tha past ten months of this year, hae heen 148,750 tone. Thie coal ie almost exclusively used for steam. It is consumed upon our river and bay steamers, in mills and manufacturing establishmants, and in some instances upon the steamers which ply hetween the ports along the coast. Its liability to spontaneous comhuetion renders it nnfit and unsafe for long voyagee. Like all the coal yet found eouth of Vancouver's Island, it contains a large percentage of water, which causes it to slack on exposure to the atmosphere. The greater part of it reaches the market as screenings. It is sold in this condition for six dollars per ton; for steam purposes the grata bars of tha furnaces are set close, to prevent waete. Notwithstanding the infarior quality of this coal, it is of immense value to the Stata, as without it all of our manufacturing interest would be paralzed.

The next largest yield of coast coal during the year has been 28,000 tons from Coos Bay. Tha eupply from these mines, which are situated on the coast of Oregon, not a great distance north of the California line, has in the last two yaars taken the place of the Bellingham Bay coal, in the San Francisco markat, for household use. Previous to 1867 the aupply from the Bellingham Bay mine was abundaut and regular. Ahout that time it changed owners, took fire soon afterwards, and has been burning at intervale ever since; the product in consequence has heen fluctuating and uncertain. The coal is hetter than that from Cooe Bay. Two mines, the Eastport and Newport, are now heing worked at Coos Bay, the cost of the coal delivered in San Francisco is not over $7 per ton. Owing to the demand, which increases faster than the facilities for supplying the market and the withdrawal of the Bellingham Bay from competition, the prices of Coos Bay coal by the cargo this fall, was raised to $12 per ton; having heretofore heen sold as low as $8.50 per ton. If able to maintain the present prices, the Coos Bay mines will hecome, although they furnish a coal of very inferior quality, the most valuahle coal mining property on tha coast. At the preeent price when landed on the wharf in San Francisco, a margin for a clear profit of $5 per ton is left for the ownere. Only 2,200 tons of Bellingham Bay have heen put upon the market during the past year. A new mine has been worked at Seattle on Puget Sound quite successfully; 12,000 tone hava been received from this source. It is almost the same quality—little hetter perhaps, than the Coos Bay. All these varieties are lignitee of more recent origin than anthracite or bituminous coal, of the proper coal seriee. In Vancouver's Island at Nanaimo, there ie a vein of good coal. The importations from that quarter have heen 22,000 tons, which have been used principally for making gas. We have also imported from Australia 91,000 tons of ahout tha same qnality of the Nanaimo. It is largely nsed for ocean steamships, and for purposee which require greater heating properties than tha California coal afford. From England 17,000 tons—6,000 tons of Cumberland and 9,000 tons of Anthracite—and from Chili 3,000 tons, complete tha importatione from all quartere dnring the time undar consideration; a total product and importation of 343,131 tone.

By order of the Secretary of War, experimente were mada last Spring to tast the comparative value of tha coals on the Pacific Coast. One cord of the atandard, merchantable, live-oak wood, was found to equal the different varieties of coal produced on this Coast in the following proportione: It required 2,600 lhs. of Coose Bay to equal a cord of wood; the same amount of Monta Diablo; 2,400 lbe. of Seattle; 2,200 lbs of Bellingham Bay, and only 1,800 lba. of Nanaimo, proving the superiority which has always been claimed for the Vanoouvar over the other varieties.

In this connection we would call attention to the discoveries of coal croppinga in this vicinity, upon Mark West Creek. While most of the apecimene are of usual Coast variety, we have in one inatance seeñ samplee of a vary superior quality. It forms a coke and has othar characteristics of a genuine coal of the true saries. If it exiats in any quantity it would prove more valuable than a gold miue. We believe that tha coal indications in the Mark Weat mountains are of aufficient promise and importance to repay carefnl examination, and wa are eurprised that some of our enterprising citizens have not turned their attention to them. If we posseae a coal-field in addition to our other resourcee, our future is indead assured.—*Sonoma Democrat.*

MECHANICAL PROGRESS.

Scientific and Mechanical Possibilities.

A correspondent of the *Scientific American*, says: Gas wells fouad in various localities indicate that immense deposits of coal oil and petroleum exist in the earth. which may be fouad st great depths; and late experiments show that we may burn it for fuel as well as for illnmination; by its nse steam boats may cross the ocesa, and locomotives fly by its aid. We are just beginning to learn the power of this new servant that man has awakened from the sleep of ages. The country also abounds in limestoue, sandstone and bituminous shales, which, by scientific and mechanical aid, may afford an almost never ending supply of this wonderful material.

And notwithtsanding the seemingly advauced state of the means of transportation, it is inadequate to the present wants of man. Steamboats and railroads do not even meet the wants of our own country. Can the possibility of aerial navigation be doubted? Every year is bringing ns nearer to the practical solution of thia great problem.

If a light motive power is required, science may yet discover a cheap method of separatiag alaminum from our clay, some of which contains as much as 30 lbs. of this most wonderful material to the tun. This metal is three times stronger than steel, and as light as chalk. On the very surface of the earth, we daily walk over a material from which the machinery for a motive-power may be constructed of about one-tenth the weight of iron or steel. In the oxygen of the atmosphere is abundant fuel, which may yet be used to rarify the air for a motive power; other powers also exist in Nature, which will, no doubt, yet become the servants of man. One discovery opens vast and expansive avenues leading to unexplored regions, where magnificent creative Nature holds in store rich treasnrea which the scientifio hand may drag from her dark *arcana*.

He who engages his mind, his time, or his fortune in the development of scientific means for bringing forth from Nature'a rich stores that which will add to the eujoyment, happiness and comfort of man is entitled to the greatest honors that can possibly be bestowed by an appreciative world.

Cracked Cylinders.

A correspondent of the *Engineer* furnishes the following with regard to the cause of the cracking of cylinders:

The chief cause of cracked cylinders in large engines is starting the engines to soon. In large ships the steam can be got up in an hour in the boilers; but the eugines should as a rule have from two to four hours to warm the cylinders, so that the metal would have no undue strain on it through unequal expansion when starting; sometimes they get it, at other times do uot. When the steam is up, and just when the cylinders are warmed enough to put the inner ring of metal in a state of compression, and the outer one in a state of teusion, the engines are started at a speed quick enough to bring over a few buckets of water from the boilers. There are a few banga and bumps, and then everything seems to be all right. But some time after, when the cylinders are opened, there is a crack found in one. Some of the cylinders in the merchant service are very large, but they receive quite another sort of treatment; steam is np from four to six hours before starting, and when they do start there is no stopping, with few exceptions, till the ship gets in port again. In the navy, large ships have been known to bank the fires and shnt the steam off the engines five times in twenty-four honrs, and to draw the fires forward, get steam np, and start the engine in from tcn to twenty minntes as fast as they could go. Now the wonder is that there are not more cracked cylenders under such circumstances.

The idea that the weight of the slide and casing ia the cause of the cracks I do not hold with. But the slide casing sometimes assists in cracking the cylinder—as, for instance, when the casing is a good deal hotter than the cylinder, and the engines are started suddenly. However, in that case it is only the webs in the ports that are cracked.

I think the cylinders in the navy are not a bit too large; for even when we get higher pressure, which we must do shortly, we shall still want a large cylinder to get the proper amount of work out of the steam.

Comparative Cost of Iron Steamers.—According to a recent report of the Wilmington Board of Trade, it was estimated that iron ships and steamers conld now be built in the Delaware ship-yards at 12 per cent. in advance of what they would cost on the Clyde. It is also stated that this margin of 12 per cent. would he entirely removed if the same inferior quality of iron were nsed on American vessels as is employed in English steamers. From the fact that manufacturers in Europe find it impossible to fill new orders for iron, based ou the recent advsnces in the raw material, and that no new keels are being laid for iron vessels, it would seem as though our represeatative American capitalists might find a grsnd opportunity in this connection.

What is a Technical, and What a Scientific Engineer.

The question has been briefly and properly answered as follows:—When an openiug is to be spanned over by a material construction, which must bear a certain weight without bendiug enough to injuro itself, there are two forms in which this construction can be made, the arch and the chain. Every part of an arch is compressed or pushed by the other parts; every part of a chain is in a state of tension, or is pulled by the other parts. In many cases these forms sre uaited. A girder consists of two main pieces or booms, of which the upper one acts as an arch and is compressed, while the lower oue acts as a chain and is pulled; and this is true even when both tho pieces are quite straight. They are enabled to act in this way by beiug tied together, or braced, as it is called, by cross-pieces, which you must often have seen. Now, suppose that any good, practical engineer makes a bridge or roof upon some approved pattern which has been made before. He designa the size and shape of it to suit the opening which has to be spanned; selects his material according to the locality; assigns the strength which must be given to the several parts of the structure according to the load which it will have to bear. There is a great deal of thought in the making of this design, whose success is predicted by the application of previous experience; it requires technical skill of a very high order; but it is not scientific thought. On the other hand, Mr. Fleming Jenkin designs a roof consistiug of two arches braced together, instead of an arch and a chain braced together; and, although this form is quite different from any known structure, yet before it is built he assigns with accuracy the amount of material that must be put into every part of the structure in order to make it bear the required load, and this prediction may be trusted with perfect security. What is the natural comment on this? Why, that Mr. Fleming Jenkin is a scientific eagineer.

The difference between scientific and merely technical thought, is just this:—Both make uso of experience to direct human action; but while technical thought or skill enables a man to deal with the same circumstances that he has met with before, scientific thought enables him to deal with different circumstances that ho has never met with before.

The Nes-Silicon Iron.

We made a lengthy reference some weeks since to a superior iron ssid to be made from a peculiar silicon ore found in York county, Pa. The remarkable qualities claimed for this iron seem to be confirmed by actual tests.

It is claimed for this ore that by mixing it with ordinary pig iron in different proportions, steel of any desired quality may be directly produced by the puddliug process. Dr. Nes, who discovered the properties of this ore, believes that its peculiar advantages for the production of steel are derived from electrical action, and that it contains no carbou, but has silicon in combination with an oxide of iron as its principal constituents. It is said that when puddled with ordinary pig iron, five to eight per cent. of the ore mixed with the iron will purify it from phosphorus and sulphur; and that the ore when mixed in larger porportions will transform the iron into excellent steel. It is claimed that steel adapted to rails, cutlery, and other purposes can be procured as desired by varying the proportions of codorus used, and that the result ia invaribly the same. The steel will bear welding upon itself or upon iron without a flux, does not deteriorate by reworking, will not rust, receives a fine temper, and can be produced at a cost of but little above ordinary iron.

The Elmira Rolling Mills have made by this process over 10,000 tons of rails which have been laid on the Erie Railroad, and it is said that not one has broken or laminated. It is reported that the supply of this ore is inexhaustable. If this is true, the importance of the discovery can not be over estimated.

More Experiments in Street-car Propulsion.—Mr. H. Frank, of Pittsburg, is making an experiment in the propulsion of street-cars by an invention which consists in the use of two cylinders, of different capacities, as 1 to 8, the smaller cylinder to be filled with gas at a pressure of 300 lbs., the other with air at the same pressnre, the pressure first to be utilized as power and then supplied in the right proportions for combustion under a vertics1 tubular boiler, where it is ignited by a small burning jet of gas. It is so arranged that no fuel is used except when the car is in motion, when of course neither steam nor smoke will be generated. The inventor claims that the fuel or gas, for a 9 horse-power engine, can be supplied at a cost of only 8 cts. per hour.

SCIENTIFIC PROGRESS.

Scientific and Technical Thought.

Prof. W. K. Clifford, in an address before the British Association, at its late meeting at Brighton, illustrated as follows the difference between technical and scientific thought:—Ancient astronomers observed that the relative motions of the sun and moon rocurred all over agaiu in the same order about every nineteen years. They were thus enabled to predict the time at which eclipses would take place. A calculator at one of our observatories can do a great deal more than this. Like them, he makes use of past experience to predict the future; but he knows of a great number of other cycles besides that one of the nineteen years, and takes account of all of them; and he can tell about the solar eclipse of six years heace—exactly where it will be visible, and how much of the sun's surface will be covered at each place, and, to a second, at what time of day it will begin and finish there. This prediction involves technical skill of the highest order; but it does not involve scientific thought, as any astronomer will tell you.

By such calculations the planet Uranus at different times of the year have been predicted and set down. The predictions were not fulfilled. Then aroso Adams, and from these errors in the prediction he calculated the place of an entirely new planet, that had never yet been suspected; and you all know how the new planet was actaally found in that place. Now this prediction does involve scientific thought, as any one who has studied it will tell you.

Here, then, are two cases of thought about the same subject, both predicting events by the application of previous experience, yet we say one is *technical* and the other *scientific*.

The Nebular Hypothesis.—As regards the stellar and planetary universe, its origin from an all-diffused, nebulous mist, was taught by Kant a century ago. This view was subsequeutly elaborated by Laplace the mathematician, and Herschel the astronomer, into the Nebular Hypothesis, which was the outcome of the whole body of known astronomical facts. This hypothesis affirmed the progressive condensation and differentiation of the nebulous mass through successive stages to more and more concrete and specialized groups, systems, and orbs. That the solar system was gradually formed in the way the nebular hypothesis implies, and that its facts cau be explained by that hypothesis and no other, is uow the general belief of astronomers. Consisting of more than one hundred and fifty bodies, revolving and circulating according to one grand method, it has been pointed out by Prof. Leconte that there are no less than three hundred and seventy facts concerning the distribution, form, and motions, of the sun and planets, which are the simple consequences of the nebular hypothesis, and can be accounted for in no other way. The uebular hypothesis is the doctrine of to-day, in its application to the most perfect of the scences, and it has replaced au *a priori* cosmogony that swayed the human mind for thousands of years before the solar system was discovered.—*Science Monthly*.

Fluorescence.—President Morton, according to the *Gas Light Journal*, has been interesting the Philadelphians with a display of some novel discoveries which he has recently made in the fluorescence of certain hydro-carbons found associated with anthracene. In the conrse of his lecture he showed the following: A large screen, of a pale yellow color, was lowered from the upper regions of the stage, and as the lecturer expressed it, was interrogated in the way of experiment as to what property it possessed, by various colors of light. A brilliant yellow, a green and a red light were successively thrown upon it from an electric lamp, but it remained unchanged and made no sign; then a violet light from the same source streaming over it the word "Fluorescence," flashiug out upon the cloth in immense letters of luminous green, at once answered the question and illustrated the property. So again a gigantic flower, painted in pale monochrome, gleamed out in varied and vivid tints, nnder a like treatment. In another place the speaker alluded to the invisible rays preseut in the solar beam and some other light, which though inappreciable to the human eye, are very active in photography, and then did, what has certainly never before been accomplished—that is, showed the rays, on a fluorescent screen, to the immense audience assembled to hear him. The invisible spectra of copper, silver, zinc, etc., were thus projected and compared.

New Use for Ozone.—A German chemist has ascertained that ozone has the power of decolorizing blood; leaving it a white and perfectly coagulated albumen, in which condition it may be used in calico printing and for some purposes for which the coloring matter in that class of albumen has heretofore rendered it useless. Ozone has also been found to act very powerfully as a disinfectant.

Polarized Light.—The difference between ordinary light and polarized light is due to the fact that while the particles in ordinary light vibrate in every direction, the particles in polarized light, whether it is produced by reflection or by the action of crystalline bodies, vibrate in only a single direction.

Low Blast Furnaces.

The Pittsburg *Iron World* says: "Logic and chemistry are on the side of low blast furnaces of from fifteen to twenty feet highth of stack. Experience favors the present outlandish steeples of stone and mortar, which like so many Babels rise up as monaments of the ignorance of the day. Iron and steel have been made in all ages of the world, and some much superior to the products of to-day; yet we neither read nor discover evidence of monstrous blast furnaces. The ancients had a way of making good iron and steel without means, or at least without such experience and unwieldy appliances, which we have yet to discover.

"Newton's first telescope was 120 feet loag and possessed but limited magnifying powers. Astronomical science has shortened the tube to ten or fifteen feet and has increased a thousand fold its magnifying power. Analogous illustrations can be found in the incipieacy of all sciences and arts. The ancients begun with a bellows of sheep-skin worked by women's feet operating within a small space on a small quantity of material, and the steel of Damascus was the product.

"The present mode of conducting combustion in blast furnaces is at war with the principles of chemistry. It will not be many years before the blast furnace conundrum will be solved. Science is on the side of the students of metallurgy who are pushing their investigations and experiments, and sooner or later we will have iron produced at half its former cost."

The Bottom of the Atlantic.—In a communication to the London Geographical Society, Capt. Osborne states that the bottom of the North Atlantic is occupied by two valleys, the Eastern extendiag from 10° to 30° west longitude, and traceable as far as the equator, with an extreme depth of less than 13,000 feet. The western valley he says, reaches from the thirtieth to the fiftieth degree of west longitude, and the two are separated by a ridge in 30° west longitude, along which the average depth is only 1,600 fathoms, and which can be traced northward to Ireland and southward to the Azores, so that it is volcanic in character at both extremes. Its extreme breadth is found to be somewhat less than 500 miles, and the depth of water is found to increase on both sides of it in accordance to the distance from the axis. From Capt. Osborne's researches in regard to deep sea beds generally, he is inclined to believe that there are no rough ridges, abrupt chasms, nor bare rock, and that the sea bottom at great depths is uot affected by currents or streams, even by those of the magnitude of the gulf stream, and that it rather resembles the American prairies in general appearance, and is everywhere covered by a kind of mud.

Effect of Magnetism on Iron.—During the recent session of the National Academy of Science, at Cambridge, Mass., Prof. Mayer gave some interesting information regarding the effect of magnetism on iron:—He states that he has discovered, by means of the Saxton comparator, that rods of iron suffered a permanent elongatiou by magnetization of one hundred and fifty-millionths of an inch. English refined iron gave the maximum of elongation; scrap iron the miuimum. Whether the current was gradually increased in intensity or whether it was sent full charge at once, it produced the same degree of elongation. With one cell the elongation took place in six-tenths of a second; with 25 cells if took place in two-tenths of a second. Prof. Pierce thought if the elongation of iron under magnetization were trne, it might make in its effect on the earth an appreciable difference in the length of the day. This could be detected by astronomy. A chauge in the day of seven-hundredths of a second would be perfectly easy to discover now.

An Interesting Experiment with Electricity.—Mr. T. C. Webb of Philadelphia has made experiments with a plate electrical machine in an insulated room, that seem to show the fallacy of the ordinary theory of the discharge of a charged conductor. A room 8 feet by 9 and about 8 feet high was constructed, snd suspeuded upon gutta percha and its perfect insulation shown by a Thomson galvanometer. The plate machine acted in all respects the same as in an uninsnlated room, sparks were given off, and the conductor completely discharged when touched to the sides of the building. The experiments given in the *Philadelphia Magazine* seem to show conclusively that the common theory of the electrical machine is erroneous.

Singular Defect in Australian Gold.—It is said that some 6,000 or 7,000 lbs. of Australian gold, known as "brittle," having recently been coined by the French Mint for the Bank of France, all the pieces have been found to admit of being easily broken, and they have therefore to be re-melted. This is attributed to the presence of a small percentage of antimony and arsenic, extremely difficult of removal; and these elements are known to produce a similar effect in all metals or alloys which are subjected to the molecular changes induced by the pressure and heat developed under the action of the dies in the coining-press.

Electricity is developed in metallic wires by merely bending them, and the development appears to be independent of any thermic action.

S. F. Stock and Exchange Board,

THURSDAY, Dec. 26th, 1872.

The business at the Board has been somewhat less than usual, owing to the adjournment over one day on account of Christmas, and in part by reason of the generally depressed condition of stock during the early part of the week under review. A reaction set in on Tuesday which continned, though somewhat quietly, on Thursday.

On Friday the market was weak, nearly all descriptions called being from $1 to $5 lower than for the corresponding Board on Thursday. Kentnck fell $10; Gould & Curry, Segregated Belcher and Yellow Jacket, each $5; Consolidated Virginia, Overman and Savage, $3 each. Several other companies declined $1 each. Hale & Norcross aad Raymond & Ely advauced $2.

On Saturday the market still continued weak, the "bear" influence having evidently been at work circnlating absurd rumors adverse to some of the Washoe stocks. At the close Belcher was $3 lower; Crown Point, $2; Cons. Virginia, $1; Gould & Curry, $7; Hale & Norcross, $3; Jacket, $4. Savage rose $1. Raymond and Ely fell $2; Overman, $1.

On Monday the market still continued dull, with a declining tendency. Compared with Saturday's rates Overman advanced $4; Belcher, Caledonia, Hale & Norcross and Consolidated Virginia, $1 each. Crown Point, Savage and Yellow Jacket each declined $2. Alpha, Chollar-Potosi and Imperial, each $1. The "bear" influence was still appareut. News from the various mines was meager, while the most extraordinary and unexplained delays iu developing some of the leadug mines were but little calculated to encourage operationsin the Board.

On Tuesday the market was stronger, there being quite a general call at the Board, and most kinds advancing from $2 to $4. From Monday noon Gould & Curry advanced $20; Crown Point, $5.50; Hale & Norcross, $4; Overman, $1; Raymond & Ely, $5.50; Savage, $4; Jacket, $2. The Board adjourned over from the morning eession to Thursday morning, to allow of the celebration of Christmae.

On Thureday the market opened with a somewhat qniet demand. Pricee were generally higher than on Tueeday. From the last previone ealee, Segregated Belcher advanced $6.50, Chollar-Potosi, Crown Point, Hale & Norcross, Ophir and Overman each advanced $2 Alpha, Caledonia, Consolidated Virginia and Savage, each $1. Belcher declined $3 and Kentuck $2. The Raymond & Ely mine has sent down $256,000 on December account.

Below will be found news from the prominent mines later than that in our "Mining Summary."

RAYMOND & ELY.—On the 19th, the sum of $33,569 was shipped; on the 21st, $31,481; on the 24th, $34,158. Previous shipments to last of this month amonnted to $190,400, which makes a total of $256,039 for 24 days, eqnal to $10,668.29 per day.

HALE & NORCROSS.—For week ending Dec. 21st, 864 tons of ore were extracted; 1,158 tons sent to mill, and 1,099 tons remained on dump.

SAVAGE for week ending Dec. 21st, 982 tons of ore were extracted, assaying $25.65 per tou; 1,107 sent to mill, and 115 tons remsined on dump.

IDA ELMORE.—A letter of the 15th says: Have to-day started up ten stamps of onr mill on our own ore, and will soon have the whole mill constantly employed on ore from our mine. The ledge is full four feet wide, and carries good ore through the entire vein. Will be ready to start ore drifts north and sonth within a few days, and commence raising ore from this level.

BUCKEYE.—Letter of the 21st says: The following is a snmmary of operations at the company's mine for the week ending this date: Ore extracted, 160 tons; ore forwarded to mill, 153½ tons; average assay valuè of ore mined, as determined from car samples, $18.62 per ton. Those portions of the mine from which ore is being extracted continue to look and yield fully as well as one week ago. Prospecting portions show no change.

OPHIR.—Letter of the 24th says: In face of drift from 465-foot station, we have struck a fine looking body of quartz, widening rapidly going north, which we are preparing to drift work on. From the end of main south drift, second statiòn, we have a crosscut west, and have started a crosscut east to prospect the ledge in that locality. The quartz being drifted on at other points remains about the same as at last report

EUREKA.—Last week's clean up was 1,600 ounces of amalgam.

SALE OF A MINE.—The Wyoming mine, located on Deer creek, about two miles below Nevada City, has been sold to Messrs. James M. Gunn and Wm. Blakey, of San Francisco, for the sum of about $60,000. The new-comere will commence work on the mine at an early day, and will find plenty of gold in it.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

MONITOR.—Monitor *Miner*, Dec. 14: Monitor Main Tunnel struck a quartz feeder 2 inches thick on Tuesday, which, is now over a foot thick and filled with sulphurets.

HOISTING WORKS are talked of for the Silver Glance.

TIMBERING and gettingready for regular work, is the report from the Tarshish.

AMADOR COUNTY.

KENNEDY.—Jackson *Dispatch*, Dec. 21: The machinery for the new hoisting works has been received and will be in runniug order in a few days. The work of sinking the new shaft is being vigorously prosecuted, and the rock taken from the old shaft continues to "pan out" well.

CALAVERAS COUNTY.

PETTICOAT.—Calaveras *Chronicle*, Dec. 21: The pay recently struck grows wider and richer as the level progresses north, and the indications are extremely favorably that the ledge will develope into a permanent, profitable mine.

UNION MINE.—Now that their title is perfected operations will shortly be resumed.

INYO COUNTY.

BONDED.—Inyo *Independent*, Dec. 14: It is understood hereabouts that the Silver Sprout mines have been bonded to a S. F. Co. for a large sum.

KERN COUNTY.

RICH STRIKE.—Havilah *Miner*, Dec. 14: Abont 3 weeks ago the Joe Walker Co. put some men to work on the Cumberland that has laid idle for eeveral years. On sinking on it they struck a finely developed ledge of about 3ft. in width and which prospects about $25 to the ton. They have about 60 tons of rock on dump which will be crnshed soon.

NEW DISCOVERIES.—Several rich ledges have been discovered uear the Grizzly Mt. Dis. within the past week. The ledges are large and $40 rock is considered commòn.

ANOTHER.—On Sunday last O. M. Onmmings and G. Freeze discovered a very valuable quartz lode in Pi Ute Dis. The ledge is said to be 6ft., prospects well, and crops out for a long distance.

NEVADA COUNTY.

STRUCK IT.—Nevada *Transcript*, Dec. 19: At the Soggs' claim, on Deer Creek, they have a first rate ledge 8ft. thick. The Sup. has purchased a new battery, aud is going to fit the mill up in first rate order for work.

IMPORTANT ENTERPRISE.—Duryea & Rose have purchased the extensive claims, ditches and water rights of Timmons, in the vicinity of Chalk Bluff, Little York township for $100,000. This purchase includes valuable miniug claims, a four-sevenths interest in the Irish ditch aud other water rights.

SCHMIDT MINE.—The mine is to be shut down for a short time to put np machinery and make arrangements for more extensive workings. Ten tons of fine specimeu rock are out which will be crushed.

IDAHO.—G. V. *Union*, Dec. 17: They have a 35-stamp mill and two rock breakers. The hoisting works and mine are in complete order, and the condition of the mine enconraging. During the year 590 ft. of drifts have been run, 189 ft. of raise made, 380 of new shaft rnn, and 11,410 tons of ore crushed. The 400 level is in 386 ft. from the new shaft; the 600 east level is in 584 ft. from the liue of the old shaft, or 414 ft. from the new shaft, and the 600 west level is into the line of the Eureka. The 700 west drift is iu 190 ft. from the old shaft, or 9 ft. from the run of the new shaft.

PLACER COUNTY.

OUR MINES.—Placer *Argus*, Dec. 21: On the Eclipse they have sunk 2 shafts. A mill is uuder way, and will be completed by the first of January. The St. Patrick mill continues to run night and day, and have crushed a qnantity of ore from the Shipley with results satisfactory to the Co. Also some 30 tons from Crater Hill, which hae paid well. The Spanish mine, since they have found the body of rich ore, have continued to drift on the ledge and find it to be a continuons chimney and very extensive.

At the Bellevue, in the three ehafts that they are sinking and running levels from, they find very good ore, and particularly from the maiu tunnel.

DUTCH FLAT.—Cor. same: The Cedar Co. is carrying on a large amount of work. They are sinking a shaft on the Deep Shaft claim

and ars down 65 ft. Tbe same Co. is running a large tunnel from the Datch Flat ravine through very hard rim-rock to tap tbeir groand on the soath side of the ravino. This Co. is also putting in a new line of flume on the Central.

PLUMAS COUNTY.

Black Hawk.—Quincy *National*, Dec. 14: Rice, Turner & Co. have made a fair season's work, and have lately been digging ditches, etc., aad getting ready for the spring rnn of water.

New Claims.—A new Ca. has been formed, and work will commence on Manday next, to bring ths waters of Clear Creek, on tho Indian Valley road, to a gravel deposit, some three-quarters af a mile from the creek.

TUOLUMNE COUNTY.

Sonora *Independent*, Dec. 21: Hesler.—At 300 ft., the vein is 10 ft. wido. Every sbot tbey pnt in the rock, fine gold is perceptible.

Griffin.—Last week on the 600 ft. level, the vein was 6 ft. wide and very rich. Rock will go over $300 per ton.

Iaan Mine.—A party has taken up tho Chrome Iron Lode, helow Montezuma. At one place, 20 tons have been taken out, and shipped off.

Finished.—The Santa Maria Mill is finished. The miaers have about 150 toas of ore out on dump that prospected hig to the pan. On the 15th inst. they were in on the load 225 ft.

Nevada.

ELKO COUNTY.

Railroad Dist.—Elko *Independent*, Dec. 21: Mr. Ronlstone contemplates the erection of an improved furnace on the Ella. He let a contract for running a tnnnel on the Tripoli 75 ft., and on the Wehfoot for 80 ft. On the latter claim the main tunnel is in 75 ft., but has to be run about 125 ft. before striking the ledge.

J. W. Hussey is pushing work on tho Last Chance and the Hussey tunnel. In the former he is stoping, taking out ore for the furnaco, which was to have started np on Taesday. The furnace is in good runniag order, consnmiag some 20 tons of ore per day. Mr. Hussey has aboat 200 tons of oro on dump, and an nnlimted quantity in sight.

American Flag.—The depth is 400 ft. A contract was let a short time ago to sink 100 ft., and about 24 ft. bave been sunk. From the 4th level contracts were let to rnn drifts east and west, one for 100 ft. and the other for 200 ft. About 30 ft. has been finished on eacb drift. There is some good ore in sight.

Sunbeam.—3 ft. of ore in sigbt with assays of $1,380 to the ton.

Pacific Tunnel.—The wiuze on the first ledge is down 60 ft., and as soon as 100 ft. is attained drifting will be commenced. A drift from the main tunnol has been commenced to tap the second ledge, which will be cut in about 35 ft., and then ore will be taken out.

Caroline.—Has completed its shaft to the depth of 100 ft. and well timbered the entire distance. A contract to sink 50 ft. more has been let.

Montana—Has reached a dopth of 85 ft. Last evening some very good rock came in.

Silver Paak—Continues to improve as depth is attained.

Pioche Champion. — Shaft down 205 ft. Working steadily.

Standard—Has two shafts, one 120 ft. deep and the otber 177 ft. Tbere are also 2 drifts.

ELY DISTRICT.

Bullion.—Ely *Record*, Dec. 14: The shipments for the week were $152,812.63.

Charter Oak.—Tbursday last a body of ore was struck 5ft. in width. Assays were immediately made and the results showed $1,300 and 1,450.90 to tbe ton. Eight tons have been hoisted to the dump.

Wide West.—A wealthy Co. has been formed in S. F. proposing to incorporate the mine with a capital stock of $3,000,000.

Pioche Phenix.—The working shaft has reached 170ft. The hoisting works are nearly completed and will be ready to start np this week. In the old works fiue ore is being steadily hoisted. Tbe Sup. expects to have 100 tons of ore milled this month.

Toeler.—Work is being pnshed rapidly ahead. The shaft is down eome 80ft. with a good ledge, several tons of ore have been placed on dump and the probability is that the coming week will show a rich body of ore.

EUREKA DISTRICT.

Rudy Hill Tunnel.—Eureka *Sentinel*, Dec. 17: More than 300ft. of tunnelb as been run, and the indications of ore are good.

Prospect Mt.—The Fourth of Jnly tnnnel has reached a point within 30ft. of the line of tbe ledge.

The Silver West Cons. Co. intend to commence a working tunnel at the Excelsior immediately. It is expected to tap the large body of ore already in sight at a greater depth.

The Morris and Whippoorwill are not being worked this Winter.

The Slow and Sure has developed a secon vein of ore of fair qnality.

The first deposit of ore in the diamond has been traced to the eud works at a depth of 75ft.

Prospect mountain tunnel having reached a length of 100ft. work is snspended probahly for the Winter,

Baln Mt..—The Hoosac is the only mine being worked at present.

Spring Valley.—A number of the most valnable mines have been sold to the Lemon M. and M. Co.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Dec. 21: Amonnt shipped from tbe Arizona since aur last issue was $6,000.

White Cloud Dist.—Tho Moonta copper ledge has been bonded to an Eastern Co. for $30,000 for 3 months.

Ellenore.—Work is boing prosecuted vigorously. At the depth attained, 12 ft. from the surface, ths lodge is 8 ft. wide, and the are richer than at ths sarface.

REESE RIVER.

Manhattan.—Reese River *Reveille*, Dec. 19: Tho Manhattan mill which closed dowa for several weoks past will start np agalu ahout the first of next week. Abont 400 tons of ore are on hand.

Belmont. — Cor same. El Dorado South Con. Co. have resumed work in tho lower levels of the El Dorado. The 400 ft. level is in 125 ft. south of the incline. Good milling ore is in tho face of tbo drift. Ths 340-ft. lovel has been run 230 ft. south, at the ond of which a wiaze is being sunk through good ore, now at a depth of 30 ft. Tho ore bodies abovo the 240-ft. level are showiug splendid ore, and are being put in shape for stoping. Over 700 tons of first-class, and 800 tons of secoad-class aro are on the El Dorado dump. Work in the Arizona is being pushed ahead fast. A great deal of very rich ore is being takeu from the old works north of the Miller incline. The El Dorado Co.'s new mill is fast approaching completion. Working in all 80 men.

Belmont Co. ie drifting below water level. The Highbridge mine is idle at present. Working in the Canfield 35 men.

Monitor Co. have commenced stopiag in the upper levels; taking out 20 tons of rich chlorides daily. Some 20 tons of second-class ore are being reduced daily which gives by pulp assay $228 per ton.

Silver Point is 13 miles west of Belmont. Ahout two months ago some fine ledges were discovered. The Europa is tbe principal ledge ia the dist. It measnres from 6 to 8 ft. in width; dips 60 degs. to tbe east; crops ont over 400 ft. Several lote of ore have been brought to town, which assay as bigh as $2,000 per ton. The Diamond, Capital and Ruby all share the same character of ore but are smaller strata.

Jefferson Cañon is 12 miles northwesterly from Belmont.

Tbe Prussian Sonth has an incline down 35 ft. Tbis vein is traced over 2,000 ft. and has fine walls.

The Prussian North has an incline down 90 ft; several toas of fine ore lie on dnmp; vein looks well at the bottom.

Sailor Boy has two inclines down 60 ft. each; has a lot of fine ore out.

WASHOE

Sierra Nevada.—Daily yield, 55 to 65 tons of good milling ore. The ore-breasts in the upper and middle portions of the miue are looking and yielding well. Tbe prospecting drifts on the 500-ft. level of the new shaft are pushed energetically ahead. The mill is kept steadily running.

Woonville.—Depth of shaft increased 30 ft. It will reach the point for the next level, 100 ft. helow the present lowest level about the 5th of next month, when the mine will be fully opened out and three mills started working on the ore.

Hale & Norcaoss.—Daily ore yield 150 tone. Incline down 75 ft. below the 1700-ft. level. The work of putting in the new pump-hobs is making excellent progress, and opening the 22th station is being rapidly accomplished.

Gould & Curry. — Sinking the incline progressee slowly but steadily, the rock working qnite tongh and hard.

Julia.—Everything will be in readiness to again commence work in the shaft by Monday next.

Kentuck. — Water from the Crown Point has prevented cross-cutting at the 1300-ft. level from peuetrating to the east wall.

Mint—Shaft down nearly 60 ft. More clay and qnartz is coming in, and favorable indications increase. The assays during the week have run over $200 per ton.

Crown Point.—The face of the cross-cut at the 1300-ft. level is in porphyry, the ore-vein being passed through. The sontb drift is in splendid ore; in fact, the ore-body at thie level looks better or is more free from waste than in the levels above.

Baltimore Con.—Shaft 379 ft. deep. Drift at the 250-ft. level in 160 ft.

Globe. — The main west drift is driven steadily ahead. Tne ore-body being developed in the raise from the tunnel-level is looking finely.

Insurance.—Tbe incline is down 80 ft., the full size of the shaft in good ore.

Arizona ann Utah.—Shaft down 218 ft. The new hoisting-works are fast being pushed forward to completion.

Jacob Little. — The ore taken out in prospecting this week has shown a larger proportion of silver than heretofore.

Utah. — Tbe north drift at the adit-level is driving ahead.

Knickerbocker.—The main drift is in 425 ft., the face in porphyry.

McMeans.—The main west drift is pnshed steadily ahead, the face in porphyry, with occasional streaks of clay and small seams of qnartz.

Pictou.—Shaft sinking with satisfactory progress.

Silver Hill. — Sinking shaft progressing well. North and south drifts at the firet level in good pay ore.

Yellow Jacket.—Drifting and cross-cutting at the 1300-ft. level, with no developments.

Mills.—Virginia *Enterprise*, Dec. 20: Of the mills on Six and Seven-mile cañons, the Sierra Nevada (20-stamp) mill is crushing 55 tons of rock per day. The Co. is sngaged in putting in two new boilers. The Mariposa (12-stamp mill) is working on Hale & Norcross rock and crushiag 42 tons daily. Evans' (5-stamp) mill is crnshiag 14 tons of Savage rock every day. Tbe Land (20-stamp) is working on Cbollar rock, aad crnshes 45 tons daily. Tho Windfield is doing its usual amount af work, as also tbe Nevada.

Belcher.—Gold Hill *News*, Dec. 21: Daily yield 320 tons. The incline is down 168 ft. helaw the 1100-ft. level and everything in readinsss for opening tho new or 1200-ft. station. Tho north drift on the 850-ft. level is in 352 ft. Work is aguin resumed in the east drift on the 1000-ft. level. The south winze from tho 1100 to the 1200-ft. level is down 42 ft. Work is also resumed in the main south drift on the 1200-ft. lsvel and will bs steadily continued until connection is completed with the north drift on tho same lovel from the incline.

Con. Virginia.—The new hoisting works are about completed. The shaft is down 80 ft. helow the 500-ft. level, in good sinking gronnd. The main north drift, on the 1167-ft. level, from the Gould & Curry is driven ahead.

Savage.—Daily yield 150 tons, worth $28 per ton. Tho incline is down 95 ft. helow the 1,600-ft. level, in good sinking ground. The south drift on the 1,600-ft. level is driven energetically ahead. Tho main north drift on the 1,600-ft. level is pressed steadily ahead, the face in good workiag ground.

Overman.—Tbe new machinery was started up day before yesterday, everything worked with clock-like precision. The work of draining the shaft was commenced yesterday, since whicb time the water has been lowered in the shaft 100 ft.

Buckeye.—All work in the prospecting drifts north, in first, second and third levels, is stopped for the present, the quantity of ore in sight being sufficient to keep the mills rnnning for the next 6 months.

Chollar-Potosi. — Daily yield 130 tons, worth $31 per ton. The work of retimbering the station at the head of the incline, and repairing the incline, is steadily progressing.

Imperial Empire.—All work in the incline is stopped at present. Prospecting on the different stations progresses.

Calenonia.—Cleaning out and repairing the main sonth drift on the 400-ft. level of the new shaft is making good progress. Tbe north drift on the 400-ft. level of the new works is cleaned out and repaired, and work in tbe face is again resumed. The south drift in the 300-ft. level of the old works is driven ahead.

WHITE PINE.

Sprucemont. — Elko *Independent*, Dec. 21: The Ingot Co.'s smelter ie running constantly, consnming 35 tons of ore per day, and producing from 8 to 10 tons of bullion.

I. W. Whitlach is working 20 men on the Starr King, which produces ore of a very rich character. He has also commenced the erection of a new furnace on the east side of the mountain, and intends to have it running in 50 to 60 days.

Mr. Bennett has abont 20 men employed on the Monarch, and is pushing work vigoronsly. Several very rich deposits have lately been struck.

Arizona.

Mines and Mining.—Prescott *Miner*, Dec. 7: Yavapai Co.—The Placer miners of Lynx and Hassayampa creeks are doing exceedingly well with the little water they have. One day recently, a Lynx creek man washed out, with a rocker, $50.

On Lower Lynx creek, Mr. Smith has been sluicing, with good resnlts.

From Bradshaw, the news is that Jackeon & Shonp's arastra ie rnnning on War Eagle ore, which ie said to be very rich.

The Marcus, near Weaver, is yielding great quantities of rich ore; the arastra is running; rock paying well.

Smith & Taylor are sinking for water, at their mill, below Wickenburg.

Various persons and companies are sinking on ledges, in almost every dist.

Mohave Co.—Judge W. J. Berry has sent ns a fine specimen of his Guusight lode, which is over half silver.

A letter from Mineral Park, informs ns that the town was wild over a rich strike in the Fairfield, said strike being a large body of ore, carrying any quantity of wire silver, and silver in other forms. This is at a depth of 5 ft. below the water line.

Colorado.

Tenth Legion Lode.—Central *Herald*, Dec. 11: Work is abont to be resumed on this lode.

Sparks Mine.—During the past few days some very rich material hae been raised to the snrface, and the pay vein of this ore exposed to view in the bottom of the shaft is one foot in thickness. This pay vein has opened out from a width of 4 inches to 12 within the last 4 ft. of sinking, and is still widening.

The new Judd & Crosby Works, at Georgetown, are again in operation, and shipped a brick worth $1,727 on Saturday.

Among the mines now extensively worked and yielding well are the Jones, Harper's portion of the California, the Kansas, the Alps, the Sparks and American Flag, abont Nevada, and the Gunnell, Leavitt, Fiske aud Briggs abont Central.

Sxco.—Colorado *Miner*, Dec. 12: This great silver mine is being actively operated and developed, and is yielding large quantities of exceedingly rich ore. 35 men are employed, and work will be continued during the winter without interruption.

Idaho.

South Mt.—Cor. Silver City *Avalanche*, Dec. 14: Work is ahont over for the winter.

The shaft house on ths Rose is completed and actnal work commenced. Sinking shows 3 feet of a ledge with first-class ore, averaging $100 to the ton.

The shaft house over the Rohie is also finished and the shaft down 18 ft. This shows ledge matter to the width of 4 ft.

W. W. Hastiags & Ca. shipped ta S. F., from tbe Crown Point, 9 tons of ore which netted them $80 per ton.

Montana.

Items.—Virginia *Montanian*, Dec. 12: F. R. Merk's steam hoisting works on the Hendrick's lode, Hot Springs Dist. are completed and in motion.

The varions lodes at Vespond are looking hetter than ever. Mr. Lewis is abont to erect a first class silver mill. On the Kremlin, on No. 1 and discovery, Billy Norwood has a shaft of 75 ft. and a 3 ft. crevice of ore that will mill from $25 to $40 per ton. Wingate's 40 ft. shaft on No. 4 displays a 2 ft. crevice of the richest rock yet found in tbe vein. Pease & Brundage, on No. 3, have a shaft of 30 ft. and a crevice of 3 ft. paying ore.

Wisconsin.—The placer mines discovered on Wisconsin and Indian creeks last fall are developing into an extensive gold field, and is thought they will next sammer give employment and hig wages to 200 or 300 miners.

Another Mill.—Mr. Owen Gaffney, who ie largely interested in Vipond, and who is in New York, will bring out a fine silver mill for the reduction of his developed leads.

Bivens.—Miners of Bivene Gulch inform us that the past has been a very successful season.

Blue Wing.—There is no let-up in tbe development and prosperity of the leads in tbe Blue wing dist.

New Discovery.—Late last evening a report wae current on the streets tbat a new and very important discovery bad just heen developed at Silver Shower Dist.

Eberhart.—The crevice of this lode has widened out to nearly 2 ft. dnring the past week's development, and the qnality of rock is better than ever.

Utah.

Strike.—Salt Lake *Tribune*, Dec. 9: An immense strike of rich ore is reported to-day, in one of the mines of the Winsor Co. in Little Cottonwood.

North Star.—Cor. same: The Temperance has a tunnel in 280 ft. which taps the ledge 68 ft. below the surface croppings. Near the back end of this tunnel tbere is another shaft snnk which rnns in mineral the entire distance. On dump there is perhaps 100 tons of ore tbat is said to be worth from $80 to $100 per ton on general average.

Flora shaft is down 150 ft., ledge runs northwest and sontheast, and pitches 45 degs. to the northeast. In tbe bottom of this inclino there is a vein of mineral varying from 3 to 4 ft. in thickness, and the casing walls on either side appear to be well formed. The ore is carbonate and said to be wortb $60 per ton.

Clipper shaft is down over 100 ft., ledge runs east and west and pitches about 12 dege. to the north. In the bottom of the incline there appears to be a small vein 8 or 10 inches wide, carrying some mineral, whicb the owners are sinking upon. Ore taken from tbis mine has assayed as high as $11,000 and the lowest run as high as $50 to the ton.

Robert E. Lee prospect shaft is down 10 ft. and sbows a fair body of mineral, apparently of high grade galena and carbonate. Thie ore will assay from $300 to $400 per ton, and it is thonght to be wortb ahont $200 to tbe ton on general average.

Palmetto has a shaft snnk 25 ft. The ledge seems to be broken, nntil reaching within 5 ft. of the bottom where the walls appear to form in proper shape. On dump there is from 15 to 20 tons of ore, the grade of which appears to be high enongh for profitable working.

Hidden Treasure shaft is down 28 ft., and shows from 3 to 4 ft. of mineral near the surface. The ore is worth abont $60 to the ton on general average. The character is mostly galena, with some carbonate.

Amongst other mines worthy of note may be mentioned tbe Shenandoah, Midas, Rebel No. 1, Deadbeat, Wild Bill, Lookout, and the Lake Superior Copper mine.

The Hoosac Tunnel.—On the 12th of December at the Hoosac tnnnel an opening was effected into the central shaft and the workmen passed from one section to another. The work of excavating this tunnel through the monntain has been in progress for over fifteen years, and is to furnish a connection for a railroad between Troy (N. Y.) and Boston. The State of Massachnsetts has loaned its credit for the pnrpose to the amonnt of many million of dollars.

Large Rolling Mill.—There is now nearly completed at South Bethlehem, Pa., the largest rolling mill known in the civilized world; the main mill being 936 feet long and 111 feet wide, the wings forming a cross 384 feet long, the whole being built in the most solid manner, of stone, iron and slate. The boilers are outside the main works, the stacks being built of the most solid iron, riveted. They are 14 feet in diameter at the base, and about 120 feet high.

As Dickene worked in a blacking factory when he was a boy, it was natnral that he shonld shine afterward.

Lecture on Fish Culture by Livingstone Stone, A. M.

Pisciculture—The U. S. Deputy Fish Commissioner before the Oakland Farmers' Club, Dec. 13.

On being introduced, Mr. Stone began hy referring to some of the prominent landmerks in the history of fish culture. Ths Chinese, as we know, havs carrisd on trade in fish ova for centuriss, and ws reed of a Chinsse law enacted 2,200 years hsfore ths Christian era for the protection of that industry. Ths next account we have of fish-culture is that of the Egyptian King Moeris, who built two pyramids on Leke Moeris, and stocked the lake with fish. The fish increassd so fast, we ars told, thet the returns were ten thousend dollars per day, and this ths king allowed the quesn as pin-money, which tradition, said Mr. Stone, we may put down es a pretty big fish story. Thsn we coms down to ths commencsmsut of the Christian ere, whsn we learn thst the Romens engaged in the art, end raised so meuy that one single fish-pond netted its owners over one hundrsd thousend dollers in a seeson. In the fourteenth century a monk, named Pinchon, took the spawn of fish and hacthsd thsm in a trough. Four hundred years later, in 1763, Mejor Jacobi, an officsr in the Prussian army, discovered en artificial process to vivify eggs. In 1842, a Frsnchmen, named Joseph Renny rediscovered ths art, but kept it a secret for some time. It, however, at last cams to the notics of Professor Coste, who visited ths plece in the mountains where Rsnny lived and examined into the process. He hrought it hefore the French Governmsnt and an ssteblishmsnt was built for the artificiel propagation of fish. The first gentleman to experiment in this country in the reising of Eastern trout was the Hon. Stephsn Ainsworth, iu 1859. He succeedsd remarkahly well, aud wes followed by the famous Ssth Green, at Caledonia, on a large scele. In 1867, Green begen hatching shad in the Connecticnt river, and in 1872, the first appropriation was mede for that culture by the United Statss Governmeat.

Mr. Stons here explained the practical rssnlts which follow the cultivation of fish. When he first commenced, a skeptical friend, a farmsr, asked him if he thought he could improve on the method of the Creator. His reply wes, Yankse-like, by asking a question: Suppose you and your predecessors act on the sama principle. We ehould all starve. Behind the naturel product, thers lies a large stock in ressrvs which can bs brought out by cultivation. If you do not sow and cultivate your crops, you will not raise enough to eet. It is the sams with fish. It is estimaed that only a few of ths millions of eggs of ths codfish come to maturity. Take a pair of trout, weighing one pound each. The female lays her eggs in a natural brook. There ehould be a thousand. Four hundred will feil of being vivified, and die. Of the 600 left, 500 will be killed dnring the winter by the sediment and fungus in the water. Of the remaiuing 100, 50 will be devoured by its numerous netural enemiee, and the chances are thet 49 out of the 50 will not live to meturity. This ie supposed to be the ratio of their life. Now, if we take those thousand eggs and are careful of them, we ehall vivify 950.

The lecturer here divided the remainder of his remarks nnder two heads—private fish culture and pnblio fish culture. Private fish culture in the United Statee has been confined almoet entirely to Eastern brook trout, the most beautiful of fish, combining all the favorite qualfties of other fish, with none of their failings. While it may be said to be a hardy fieh, it dies easily in warm water. They can be almost starved and carried a great distance, and they are easily domeeticated. They are aleo remunerative, for as a rule, it costs but fifteen or twenty cents to raise a pound, and they command a uniform price of one dollar per pound at the ponds in the East. When the law ie first off, they bring $1.25. They can always be sent to market and get seventy-five cents.

Perhsps some of you would like to know something about the interior of a fish-breeding eetabliehment. Suppose we had 1,000 trout in eummer. The epawning season in New England comes on in October. The usual method of procuring the epawn is to strip the fish. In this way the moet egge are retained. A second procees is by the Ainsworth spawning screens. The screen is covered with gravel and upon this gravel the fish epawn. At night the operator goee to the lower screen, npon which the egge have fallen, and takes them out. A third method is by the Collins' roller spawning box, which ie a modification of the Ainsworth screen principle. Having got our egge, we take them to the hatching troughs, and all we have got to do to them hesides turning the water on them is to see that they are let alone. This ie not easy, however, for in all springs there ie a fine eediment, invieible particlee of dust, which ie fatal to the eggs. There must, then, be some system of filtering above the troughe. Screens of flannel are bset. Another danger is the fungus, a low order of vegetable growth, which, when it once gets on the egge destroys them. At firet a great deal of trouble was expsrienced from this evil. Wooden troughs were ussd, and fungue grew out from the aides of the box. The remedy for this is to ohar the box with fire to the depth of one-eighth of an inch. A third danger is from fungus which proceeds from dead eggs, but this is avoided by picking out the dead eggs once svery twsnty-four hours. Then thsre are the naturel snemies of the eggs, and thsy ars legion, consisting of almost evsry kind of water inssct, and every kind of animel that is not afreid to wet its bill or feet. To protect the sggs against thsse, cover the troughs.

The period of incuhation of trout and salmon eggs varies with the tempereture of ths weter. As a safs rule we may asssrt thet water of 50° temperature will hetch the eggs in forty days, end for evsry degree coldsr the eggs will bs five days longsr in hatching. For evsr dsgres above 50° the time is shortened five days, hut for hatching trout the temperature should not be above 55°, and 50° is hetter than anythiug higher. When one-third of the psriod of incubation is passed, the eys-spots of the fish show, and this is the time to pack them for transportation—not sooner. They may he cerrisd long journeys in wet moss. Ths spsaker said he had sent a large number to Englend, and hs had ths honor to say thet Her Majesty has some which hs ssnt to her. He hed also ssnt ssveral thousand salmon eggs this fell from the McCloud river in this State to he put in the Susqnehanna. During ths other two-thirds of the hatching period, ths eggs continue to grow in firmness. When first hatched, the yolk has hardly been touched, and the young fish appeer with it attached to thsm. They have no fully dsveloped mouths, end are sustained by absorbing the yolk. About six wssks after hatching, ths yolk sec becomss absorbsd and the young fish are ready to eat. During this period two curious instances taks possession of them. The first shows itself in about fifteen days after thsy are hatched, in an nncontrollable desire to hide nnder something. They are helplsss and seem to fear some denger. If there are any small chinks in the trough, thsy will crowd into them and die of suffocation. The other trouhle referrsd to seizes thsm a short tims leter. It is a desire to pursus a currsnt. If there is a leak anywhere in the hox, they will meks for ths current end all go through.

The best food is common sour milk curd and liver grated fins and mixed together. There is no trouble in getting them to eat. After three wesks, a new trouble shows itself. Thsy lose their 'eppetits, bscome emacieted and turn around and hsad down stream, a bad sign in trout. This trouhle is cured by placing a thin leyer of fresh earth in the bottom of the trough, In fifteen minutes ths effsct is megical. They improve and soon become better than evsr. The loam seems to furnish some needed food, and also servss to keep ths water pnre by covsring the stale fsed thet has sunk to the bottom.

At the end of the first year, a hrook trout is from five to seven inchss long; ths nsxt year it doublss its sizs, and the next. At the third year it wsighs a pound. Looking at it in a pecuniary aspect, it is rsmnnerative. Whsn you have fed five pounde of meat, yon have about one ponnd of trout, under favorable circumstances.

Public fish culture in the United States deale principally with black bess, ehad and selmon. The modus operandi of cultivating black bass ie ae follows: The Stete makee an appropriation of money, the Commissionere go to work and get the fish and put them in pouds or lakes and let them grow. That ie all there is about cultivating them. Shad are hatched, put in a river, and left aloue. The cultivation of salmon is more complicated. Ten yeare ago there was not one black bees in New England. The Commissioners put them in ponde that were worthless for food-producing purposes, and they are now taking them out by tons. It is a trite remark that an acre of water will produce as much as an acre of lsnd. Now, about shad. In 1867, Seth Green made a proposition to the Maesachueetts Fish Commissioners to go to the Connecticut river aud hatch shad. This was the inauguration of shad raising. Massachnsetts paid Mr. Green two hundred and fifty dollars, and he loet five thousand dollare wort h of fish at his ponds while he was attending to the work. He did not know at first that shad reqnired warm water, and the first experiment in such water as would suit trout was not successful. In the river where the temperature of the water was 80°, he put in another lot. After a few hours the eye spots appeared and he knew euccesa was his. The epeaker here read from a printed report of the Massachusetts Commissioners, showing the most wonderful increase of ehad resultiug from this experiment. The quantities taken out were eo enormous that alarm was felt lest the river might be drained of them, and there was some talk of a protective law. Seth Greeu told them to let the fishermen go ahead; that he could put more shad in the river than they could take out, if they fished all the time. Shad fell from 30 cents to 3 cents per pound, and what had been the rich man's luxury became the every day diet of the poor man.

As to what has been done in thie State, Mr. Stone said that abont a year ago, the California Fish Commissioners employed Seth Green to briug some young shad to the Sacramento. They were put in at Tehama, but it is not absolutely certain that any of them have been seen eince. About a month ago, some fish were seen in the river where the Pitt river emptiee in, and several persone who came from Connscticut pronounced them shad. The Indians would have nothing to do with them, a fact which provee the fish were strange fish to them.

In answer to a question as to the relative merits of the Eastern trout *(salmo fontinalis)*, and the brook trout of California, Mr. Stone spoke decidedly in favor of the Atlantic species. Fortunatsly it hes hesn successfully introduced by the Acclimation Society.

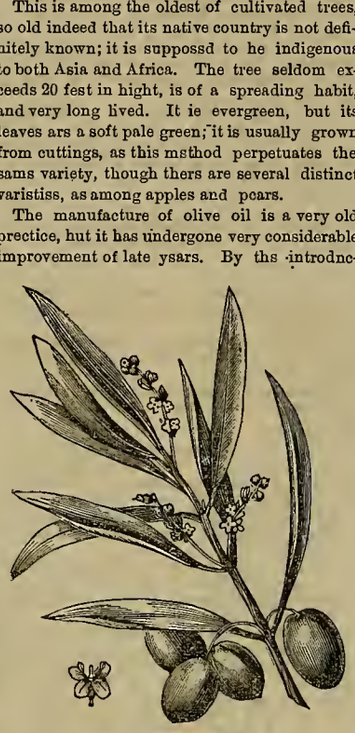
Mr. Stone closed his rsmarks by urging the enactment of a lsw to protect onr selmon, which he seid would be scarce et no distant day if not protected.

San Jose Woolen Mills.—The *Mercury*, in noticing the woolen mills of San José, gives the following statistics: Eighty-five hands are now employed at the factory; twenty-four men, three young ladies, five boys, and fifty-three Chiuamen. The boys have light but steady work, and the girls pick the knots and specks from the white blankets, with a burling iron—very easy but confining work. There are three sets of cards in operation, and eight spinning jacks—three of whioh areself operating—and twenty-two looms. Thirty-five hundred pounds of yarn are used per week, two hundred and seventy-five pairs of blankets made, three thousand yards flannel and from fifteen to twenty-five hundred yards of various kinds of men's clothing woven, thus making about twenty thousand dollars' worth of goods finished up per month for wholesale trade.

The Olive Tree.

This is among the oldest of cultivated trees, so old indeed that its native country is not definitely known; it is suppossd to he indigenous to both Asia and Africa. The tree seldom exceeds 20 fest in hight, is of a spreading habit, and very long lived. It ie evergreen, but its leaves ars a soft pale green; it is usually grown from cuttings, as this msthod perpetuates the sams variety, though thers are several distinct varistiss, as among apples and pears.

The manufacture of olive oil is a very old prectice, hut it has undergone very considerable improvement of late ysars. By ths introdnc-



THE OLIVE BRANCH.

tion of hydraulic presses, the expreesing of the oil is now mnch more rapid and effectnal, and the injurious effects of incipient fermentation, or those attending the heating of the pulp, are thus avoided.

The olive is found at nearly all the old miesions of Middle and Southern California, and its propagation might be extended largely, and with profit. We are indebted to Mr. John McComb for procuring the twig of olive from which we have made onr engraving. It came from San José, where the tree seems at home ae regards both soil and climate. In our illustration, both leaf and fruit are reduced to one fourth the natural size.

The Wheeler Expedition.—Most of the members of the Wheeler expedition have returned to this city or to Salt Lake. At the latter-named place Colonel W. M. Ord is waiting for the arrival of those parties who have not yet come in. Lientenant Wheeler has gone to Washington. His report is looked forward to with much interest. The expedition lost but one man during its travels. He was suffocated in a quicksand in which his horse foundered, in the George river. It is believed that Lieutenant Wheeler expects another appropriation for a new survey and consequently the mules used by the explorers will not be sold, but turned out to pasture, and the wagons, etc., stored.

Australian Nugget.—A five hnndred and thirty-eight ounce gold nngget wae lately found in Australia. It was in the wall of an old trench that wae cut about nine years ago, when a large number of men were at work in the locelity. The successive rain-falls had, with the continuous waehing and crumbling away of the soil, bronght this handsome little fortune into deylight.

Co-operative Mining.

There should be more co-operative mining in the Grass Velley district. Thsrs is one incorporated company here, which is doing that kind of mining, and there shonld be ten instead of one. The one compány is callsd "The Gress Valley New Mining Company," and its stockholders are mostly minsrs who work by the day, for wages. Thsse stockholders set apert a csrtain percentage of their wages every month to pay assessments on the stock of the compeny and the money thns accumnlated is spsnt in prospecting. Ths money is carefully manegsd by Trustses who understand mining and who are carefnl husiness meu. Some of the stock of the company is held by merchants and traders. As the nnmher of sheres is large the monthly burden to each individuel is light. Ths result may be great. Already the company has a good show of making one good mins, and active work to find good ledgss is constantly being prosecuted. We say thet thsrs should be ten such compenies. There ie population enough here to keep ten such companies running all the time, and surely ths district hes gold beering ledges enough to encourege the formation of such companiss. Lst us hear of more incorporations similer to the Grass Vallsy New Mining Company. Our people must help thsmselves in this matter of mining. It is nonsenss to locate a ledgs and then to wait until San Francisco, or othsr outside capitel, shall coms along to take hold of the ledge and to make it into a mine. Not so heve the many of our minss heen made. The outside cepital comes for the purchasing after the mine is made. The developing capital must bs furnished by home people, in the shaps of work or money. Look at the Idaho mine, a home development and even yet a home owned mine. We verily bslieve that thsre are other ledges hsreabouts, coucealed under ground, that are as good as the Idaho. Our peopls should join together to ssarch for snch ledges. By sserching for the few best the many good ones will be discovered and devslopsd. Ths subject is worth the serious consideration of ell classss of onr population. Propsrty ownsrs, traders, professional men as wsll es the working minera areintsrestsd in the subjsct. Local prosperity ought to bs achisved, in a great measure, by local co-operative mining.

Transportation of Crops.

Ths Prssident in his late message callsd the attention of Congress to ths fect that the productions of the country were incrsasing in a much greater proportion than the means for their transportation. Whether this hs true or not, it is en undoubted fact that the cost of transporting crops from the Western Stetss is too great to make the labor of the producer remunerative. Whether these high tariffe are due to the scarcity of transportation or the extortion of monopolies, makes but little difference in the remedy to be applied, which is suggested in the message.

The President recommends the gathering together of all poseible informetion, by meane of eurveys and otherwise, in regard to feaeible routes for canals from the west to the tide weter of the Atlantic, in order that Congrees may, when required be able to apply the right remedy to a matter which ie eerioualy threatening the material prosperity of the country.

Three great routee have been suggested. One to connect the Missiseipi Valley with the Atlantic at Charleston and Savannah, by way of the Ohio and Tennessee rivers, and by canals and elackwater navigation to Savannah and Ocmulgee. This route has becn eurveyed by an eminent marine officer, and declared perfectly feasible. The second ronte is by the exteneion of the Kanawah and Jamee River Canal to the Ohio; and the third, by the extension of the Chesepeake and Ohio Canal.

These two latter routee will be proposed for the consideration of Congress at its present seesion. In carrying grain, and, in fact, any kind of freight in quantity, railroads cannot begin to compete with canale, the difference in price much more than offsetting the difference in time. With these canale in operation the producers of the West would have ample and cheap transportation. If the present state of affairs is due to the scarcity of transportation, this would supply it; if it is due to the extortions of monopolies, the construction of these canals would eecure a competition the full benefit of which wonld accrue to the producer.—*San Jose Mercury.*

Sand Spouts.—We copy the following from the Virginia City *Chronicle* of the 13th instant: Half a dozen "sand-sponts"—columns of sand drawn up by whirlwinds—were to be seen on the twenty-two mile desert yesterday afternoon from 2 till nearly 3 o'clock. They waltzed abont, keeping always abont the same distance apart, and moving in the same direction, each apparently a solid column ten feet in diameter and 1,000 feet high. The top of all these columns seemed to be cut off by a brisk breeze from the west, which carries the dust in clouds over the range of mountains lying to the east of the sink of the Carson; sometimes two of these "sand spouts" or whirlwinds—call them what you may—come together, when they explode with a loud report, and both instantly disappear.

Useful Information.

Ought Shingle Roofs to be Painted?

If it is an economical practice to paint any *other* part of an architectural structure, most assuredly it is a commendable practice to paint shingles. We nsvsr could understand why csrtain builders have persistsd in advocating *not* to paint shingles, except we judge them to be influenced by mercenary motivss. Evsry intelligent builder is aware of the fact, that shingles and siding, when *not* painted, will wear ont very much sooner than if they had lieen protected hy a generous covering of paint. Hence, reasoning from a selfish policy, it is hetter *not* to paint shingles, *because* the paint will promote their durahility, aud whatever promotss their durability tends to diminish the labors of the craft, and thns curtail thereveuue of civil architects.

The honss in which the writer was born was covered with shaved pine shingles in ths year 1805, at which time the roof received a generons coat of oil paint mads of linseed oil and Vsnitian red. After twenty years had elapssd, another coat of paint nearly hlack was applied. Since that period, no paint has been applied, and it is now a good roof, for an old one. It does not leak, and the only rspairs on it have consisted of a shinglo added here and thers, where a portion of a poor shingle was worn ont. If ths roof had not been painted, the buts of most of the conses wonld havs leeu worn sutirely away; and, if such long psriods had not heen allowed to intervene between the times of painting, ths roof wonld have been a good one, even after the lapse of a hundred years.

Some ons once suggested, that, if the roof is painted, the paint will canse the watsr to back up beueath the next course of shingles above, which will thoroughly saturate the two courses, and thus the decay of the roof will be hastened. That is unmitigated uonsense. There is not a word of truth in the assumption. On the contrary, when the surface is painted, the water will glide away so quickly that it will not be drawn back between the coursss of shinglss half so readily as it will be wheu no paiut has besn applied.

How to Paint.

Ths trne way to paint a roof is to apply paint of some kind to both sides of ths shiugles. It is quits as important that the nnderside of every shingle be covered with paint as the surface, to prevsnt the water from being drawn up between the courses by capillary attraction. If good shingiss are painted on both sides, and good paint be applied to the roof ones in ten years, it will continue leak-tight for more than a hundred years.

When it is not dssirable to save the water for drinking, coal-tar is an excellent and chesp paint for preserving shingles, and it will pay well to smear a roof with this material once in four or fivs years. When roofs are uot painted, moss is liable to collect at ths bnts of every course of shiugles, which promotes their decay more rapidly than alternate rain and sunshine.

When oil paint is used for painting shingles, it is always better to employ some light color rather than black, as the apartmsnts of the attic story, bsneath a blaek roof, are liable to be uncomfortably hot in the summer; and more than this, as black paint absorbs more heat than any other color, neither the paint nor the shinglss will endure as long as if the roof had been covered with soms light-colored paint. A metallic roof covered with light-colored paint will last mnch longer than if it had been paintsd with black paint. The most economical paint for a roof is a generous coat of coal-tar once in a few years; but coal-tar will color the water for five years after a coat is applied to ths roof.—*Industrial Monthly.*

Is it Instinct?—We nsnally explain all the actions of the lowsr animals as being guided by instinct. On this snbject, Mr. A. R. Watson, an sminent scientist, writss: "It is said that birds do not learn to make their nests as man does to build, for all birds will make exactly the same nest as the rest of their species, even if they have nevsr seen ons, and it is instinct that alone can enable them to do this. No doubt this would bs instinct, if it wers true, and I simply ask for proof of the fact. This point, although so important to the question at issne, is always assumsd without proof, and even against proof, for what facts there are, are opposed to it. Birds bronght up from the egg in cages do not make the characteristic nest of their species, even though the proper materials are supplied them, and often make no nest at all, bnt rudsly heap together a quantity of materials; and the experiment has nsver hesn fairly tried of turning out a pair of birds, so brought up, into an inclosure covered with netting, and watching the result of their untaught attempts at nest-making. With regard to ths song of birds, however, which is thonght to be equally instinctive, the experiment has been tried, and it is found that young birds never have the song peculiar to their species, if they have not heard it, whereas thsy acquire very easily the song of almost any other bird with which thsy are associatsd."

Gas-Proofing India-Rubber.—Thongh thsrs is nothing particnlarly novel (to chemists, at least) in the following, from an English exchange, some readers may uevertheless like to have the item:—

"Ordinary vulcanized india-rubber tubing becomes saturated with gas, which sgain evaporatea at its outer surface, causing a most disagreeable smell. An invention for ths prevention of this, by coating the india-rubber with varnish, has been patented. The chief novelty in it is that the varnish is easily made, and it renders the substance of the tubs impervious to gases. This varnish is composed of linseed oil, fins litharge, or whits lead, in ths proportion of ons quart of oil to one ponnd of litbargs. These snbstances should he well boiled together until brought to a proper thickness or body, and while hot the composition is applied by running it through the tubo to he coated or lined. The varnish for the outside is made by mixing one quart of linsced oil with half a ponud of litharge, and by adding to the sams about a gill of gold size. These ingredients shonld be well boiled together, and while hot shonld be applisd with a brnsh or sponge.

Artificial Gems.—We saw, says the *Boston Journal of Chemistry*, a few days ago, in the hands of Alvan Clark, Jr., some wondsrfnl artificial rubies, emeralds, and sapphires, and some very fins artificial diamonds. They wers all made by a Frelch workman, and the smeralds ars so perfect that they have evsn deceived experts. Oue of them was shown to a celebrated jeweller in Boston, soms time since, and he at oncs prononnced it genuins, and gave his rsasons for so doing. He said it was worth at least $150, while in reality it was not worth mors than $5. The rubies have the exact composition of ths native gems, and differ from them only in hardness. The process by which these gems are manufactured is known only to the inventor.

Varnish to Imitate Ground Glass.—The *British Journal of Photography* gives the following receipt for this purpose: Dissolve ninsty grains of sandarac and twsnty grains of mastic in two onnces of washed methylated ether, and add, in small qnantities, a snfficiency of benzine to maks it dry with a suitable grain—too little making the varnish too transparent, and too much making it crapy. The quantity of henzins reqnired depends upon ita quality—from half an an ounce to an ounce aud a half, or even more; bnt the best resnlts are got with a medium qnantity. It is important to nss washed ether frse from spirit.

What to Read.—Are you deficient in tasts? Read the best English poets, such as Thompson, Gray, Goldsmith, Pope, Cowper, Coleridge, Scott, and Wordsworth.

Ars you deficient in imagination? Read Milton, Akenside, Burke, and Shakespeare.

Are you deficient in powers of reasoning? Read Chillingworth, Bacon and Locke.

Are you deficient in jndgment and good sense in the common affairs of life? Read Franklin.

Ae you deficient in sensibility? Read Goethe and Mackenzie.

Are yon deficient in political knowledge? Rsad Montesquisu, the Federalist, Webster and Calhoun.

Are you deficient in patriotism? Read Demosthenes and the Life of Washington.

Oil on the Woonwork.—Carefully conductsd experiments have demonstrated the fact that seasoned wood, well saturated with oil when put together, will not shrink in the dryest weather. Wheels havs bssn known to rnn many years, even to wearing out the tirss. Very many dollars to individual farmers might bs saved annually in blacksmith's bills, especially in such seasons as the past, if this practice was adopted. Boiled linseed oil is the best for general use, although it is now known that crude petrolenm on even old whesls is of great benefit.

How to Make Colored Chalk for Tailors, Use. — Knead together ordinary pipe-clay, moistened, and ultramarine for blue, finely ground ochre for yellow, burnt ochre for red, etc., until they are uniformly mixed; roll ont into thin sheets, cut, and press into wooden or metallic monlds well oiled to prevent sticking, and allow to dry slowly at ordinary temperature, or at a very gentle heat.

Value of Chemical Experiments.—Not long ago, the whole stock of paraffine, in the world did not sxcesd 4 ounces, which was carefnlly preserved in ths laboratory of Prof. Liebig as a chemical curiosity. There is now produced in Scotland alone not less than 5,800 tons annually. It thus often occura that the nnpaid labors of the chemist are made to benefit the world.

Spontaneous Combustion of Coal.—A piece of bituminous coal lying on some dry pine boards against the side of a building in Millport, N. Y., spontaneously burst into flames on one of the recent hot days. It had been exposed to the rays of the snn nearly all day, the thermometer raging from 100 to 105 degrses in the shade.

A New Green.—It is announced that a green of nearly the same brilliant shade as the poisonous "Paris green" may be obtained by taking twenty parts of oxide of zinc and one of sulphats of cobalt, mixsd into a paste with water, and exposed to a red heat.

Good Health.

Cold Weather and Warm Blood.

We should never allow ourselves to forget that nature intended us for warm blooded animals. In this climate of snrprising changes, we are very apt to forget it, sspecially in the fall and spring. At snch seasou, when we freeze and simmer on alternate days, there is engendered in us a certain recklessness, which takes no heed of cold or heat, dampness or dryness, and receives all temperatures with the same front, generally a defenseless one. It is certainly very troublesome to change front as often as ths weather, and there is prejudice in American minds against such change, which has a great deal to do with the rapidly increasing population of our graveyards.

People like to have some stability of purpose, and if they can have it in nothing else they will have it in dress. They will not make a change until they make a permanent one for the season. No matter how hot it is in the spring, they will wear spring clothes until summer, and no matter how cool it may he in August, summer clothes mnst bs worn until fall shall actually set in. Thus oft-times suddenly and with sad resnlts we find ourselves approaching the condition of the fishes and lizards—for the chill, that alert forernnner of disease, is ever ready, in our climate, to take advantage of circnmstances.

We suppose that there are no people in the world so indifferent to the demands of the weather—sspecially cold weather—as Americans, and one reason of this is that very many of us are ashamed to keep warm. To wrap up and button up and to button down windows whenever thers is a chilling change in the air, argues, to most minds, a namby pamby eagerness to be well that is repugnant to the hardy American soul. So, rather than bs laughed at, we shiver. We prefer tragedy to comedy, the grave to the ridiculons.—*Scribner's for November.*

Treatment of Poisonous Bites in Persia.—Mr. Flandin, in his narrative of a rssidence in Persia, relates a cnrious incident, which ocenrsd when he was at Ispahan: The Persian servant of a European had bsen stung by a scorpion, and his master wished to apply ammonia, the usual remedy in such cases, but the man refused, and ran off to the bazaar. When he retnrned he said he was cured, and appsared to bs so. The Eurepean, rathsr surprised at this almost instantaneous cure, qnestioned him, and found that he had been to a dervish, who, he said, after examining the wound and uttering a few words, had several timss touched it with a little iron blade. Still mors astonished at the remedy than the cure, the Enropean desired to see ths instrument by which the latter was said to have heen effected. At the cost of a small picksch he was allowed to have it for a few minntes in his possession. After a carefnl examination, finding nothing extraordinary in the instrument, he made up his mind that the cnre was a mers trick; that the dervish was an impostor; that the scorpion sting had not penetrated, and that his servant had been more frightened than hurt. He threw the blade contemptuonsly upon the table, when to his great surprised, hs beheld it attach itself strougly to a knife. The quack's instrument was simply a msgnst. But what power had the loadstone's attraction over venom? This discovery was very odd. Incredulity was at a nonplus, and yct ths man stung by a scorpion was cnred, and he who had cured him was in great renown at Ispahan for the treatmsnt of that sort of wound.

A New Chill Cure.—The local of ths Terrs-Hauts *Journal* has discovered a new cure for ague. Hers it is: To those afflicted with ague we say emphatically, crawl down stairs head-foremost. Laugh at ths idea, if you please, but do your crawling first; you can then afford to laugh. Just as the chill is coming on, start at the top of a long flight of stairs and crawl down on your hands and feet, head, foremost. You nsver did harder work in your life, and when yon arrrive at the bottom, instead of ahaking, yon will find yourself puffing, red in the face, and perspiring freely, from the strongest exertions made in the effort to snpport yourself. It will effect a cure, beyond a doubt; but whether from this cause or from that, we will never tell you, nor need you care to know. Try it. It won't cost yon near as mnch as quinins or patent medicines, and if it fails, it will only do what they do every day. If it cures, as it certainly will, lay the facts before our local scientists, and let them discover the cause. At all events, ye shaking sufferers, lay this maxim to your hearts: "Crawling down stairs head-foremost will certainly prevent a chill."

Salt and the Ague.—The followiug appears as a leading editorial in the Cleveland *Herald:* "We wish to give a simple remedy for fever and ague, and wish to emphasize it by saying that it has to our knowledge proved very efficacious. It is simply common salt. A teaspoonful taksn in water, aud a teaspoonful deposited inside each stocking, next the foot, just as the chill is coming on. That's all there is of it; but knowing that it has heen very efficacions in 'breaking' a chill and perfecting a cure, we put it in our editorial columns, whers no humbug remedy shall ever find a place if we know it.

Ague or Intermittent Fever.—This disease consists of cold, hot, and sweating stages in succession, attending each paroxysm, and followed by intermission. The cold stags commences with languor, a sense of debility, and sluggishness in motion, freqnent yawning and stretching, and an aversion to food. The face and extremities become pale; the fcaturss shrink. At length the patient feels very cold, and universal rigors come on, with pains in the head, back, loins and joints—nanssa and vomiting of bilious mattsr; ths respiration is small, frequcut and anxious; sensibility is greatly impaired; ths pulse is small, freqnent, and often irregular, aud the shiverings terminate in a nniversal and convulsive shaking.

These symptons, abating after a short time, the second stage commences with an increase of heat over the whole body, reducss of the face dryness of the skin, thirst, paiu in the head, throbbing in the temples, anxiety aud restlessness; the respiration is fuller and mors free, but still frequent; ths tongue is furred, and the pulse has become regular, hard and full. If ths attack has been very severe, then perhaps delirium will arise. When these symptoms have continued for some time, a moisture breaks out on ths forehead, and by degrees becomss a sweat, aud this at length extends over the whole body. As this sweat continues to flow, the heat of the body abates, the thirst ceases, and most of the functions are restored to their ordinary state. This constitntes ths third stage. Wheu the paroxysms are of short duration, and leave the intervals quite free, we may expect a speedy recovery; but when thsy are violent, and attended with much anxiety and delirinm, the event may be donbtful. Marsh miasma, or the fluvia arising from staguant water, or marshy grounds, when acted npon by hsat, are the most frequent causes of this fever.

The bilious, remittent and intermittent fevers which are so prevalent in the valleys of ths great rivers throughont the United States during the Snmmer and Antumn, and remarkably so during seasons of unusual hsat and dryness, are iuvariably accompanied by extensive derangements of the stomach and liver, and other abdominal viscera. There are always more or less obstructions of ths liver, a weakness and irri table state of the stomach, and great torpor of the bowels, clogged up with vitiated acenmulaitons. In their treatment, a pnrgatives, exerting a powerful influence upon these various organs, is essentially necessary.

A Dangerous Paper.—The green paper used to wrap abont lozenges, sold in shops, railroad cars, and on the street corners, has long been suspected to contain arsenic, and with the view of ascertaining the facts by analysis, we recently purchaseda roll of lozenges coversd with this paper.

A qnalitative examination of the paper afforded all the characteristic reactions for arsenio and copper. The wrapper contained 20 sqnare inches of paper. Of this, 16 were taken for quantitative analysis. The resnlt of the examination showed that this portion contained .1516 grams, or 2.34 grains of metallic arssnic. This is equivalent to 2.94 grains in the whole of the wrapper, a quantity sufficient to destroy life in an adult person. Children in all parts of the country ars allowed to purchase the lozenges covered with this poisonous papsr, and the rolls are often pnt into the hands of infants, as a plaything. As everything goes into the mouth of young children, it is easy to see that no mors dangerous snbstance can pass into a family, than tisse packages of confectionery. It is quite probable that instances of poisoning have occnrred from this canse, which have been of a serious or fatsl character. There should be laws prohibiting the use of poisonons papers for any purpose.—*Boston Jour. Chemistry.*

New Plan of Extracting Bodies from the Ear.—Dr. Loewenberg, of Paris, dscribes a new plan for extracting solid bodies from the ear. A very small brush is made by rolling and fixing a narrow strip of old linen around a thin wooden handle (a match, for instance), and unravelling its free border to the length of a qnarter of an inch. The end of the so obtained fringe is dipped into a warm and very concentrated solution of glue, applied to the visible part of the foreign body—or rather the operator leans it against the body by letting it glide very softly, aud without exercising any pressnrs, over it. Previous to the application, the patient seats himself comfortably in an arm-chair or on a sofa, and inclines his head toward the healthy ear. He remains in this position for for three-quarters of an hour after ths introduction of ths agglutinated brush. This time past, consolidation is generally accomplished, and the foreign body can be extracted by gently pulling at the brush.

Medical Treatment of Mr. Greeley.—Medical skill was exhausted in trying to save the great journalist. Every remedy and appliance was used in his case. One operation was reported which is but seldom witnessed in the treatment of mental maladies. It was performed by Dr. Brown Seqnard, formerly of Paris, the highest medical authority on mental complaints. It consisted of the application of an iron heated to a white heat. Thia was drawn quickly down his spinal column from the neck to the hip-joint, in the hope that it would draw the inflammation away from the brain. Ths patient was in a torpid condition, and apparently did not experience any sensation from the operation.—*N. Y. Sun.*

Table of Contents.

GENERAL EDITORIALS.—Japanese Minerals and Mining, 401. A Word for Ourselves—1872; A Mining Retrospect; Importance of the Coast Survey, 408. Experiments in Fuel—Cheap Irrigation; New Books, 409. ILLUSTRATIONS. — Improved Vapor Burner for Warming Rooms; Thompson's Tunnel Car; Growing Plants from Cuttings, 401. The Olive Branch, 406. The Cal. Poppy, 409.

MECHANICAL PROGRESS.—Scientific and Mechanical Possibilities; Cracked Cylinders; Comparative Cost of Iron Steamers; What is a Technical, and What a Scientific Engineer; The New Silicon Iron; More Experiments in Street-car Propulsion, 403.

SCIENTIFIC PROGRESS.—Scientific and Technical Thought; The Nebular Hypothesis; Fluorescence; Low Blast Furnaces; The Bottom of the Atlantic; Effect of Magnetism on Iron; An Interesting Experiment with Electricity; Singular Defect in Australian Gold, 403.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, and Utah, 404. Market Reports, 412.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 404.

USEFUL INFORMATION.—Ought Shingle Roofs to be Painted; Is it Instinct; Gas-Proofing India-Rubber; Artificial Gems; Varnish to Imitate Ground Glass; What to Read; Oil on the Woodwork; How to Make Colored Chalk for Tailors' Use, 407.

GOOD HEALTH.—Cold Weather and Warm Blood; Treatment of Poisonous Bites in Persia; A New Chill Cure; Salt and the Ague; Ague or Intermittent Fever; A Dangerous Paper; New Plan of Extracting Bodies from the Ear; Medical Treatment of Mr. Greeley, 407.

DOMESTIC ECONOMY. — Putting up Stoves; American Dict; How to Save Coal in Open Grates, 411.

MISCELLANEOUS.—A Chat About the Grass Valley of To-Day; The Vultures of our Mining Interests; Ophir Mining Co.; Gold Hunting in Columbia; Discovery in Mendocino; Sulphur Mines; Coal Market—Discoveries Near Santa Rosa, 402. Lecture on Fish Culture by Livingstone Stone, A. M.; San Jose Woolen Mills; The Wheeler Expedition; Co-operative Mining; Transportation of Crops; Sand Spouts, 406.

Mining Secretaries, Attention!

On the first of Jan. 1873, the mining assessment law of the new California Code comee into effect, and it will be well for all mining Secretaries to examine the ssme. It was pnblished in the MINING AND SCIENTIFIC PRESS of Dec. 7th, 1872. We will furnish free copies of the new law on applicatien at this office.

THE PERUVIAN MINES TO BE OPENED TO FOREIGNERS.—It is eaid that the Pernvian Government has under consideration, with every prospect of approval, a proposition to throw open to any one, native or foreigner, the right to work tbe mines they may discover within its territory, with a greater extent of lsnd than was allowed by the old Spanisb mining laws. The working of coal ie to be particularly favored by certain additional privilegee, while the State will buy tbe coal of euch mines in preference, at the cnrrent market pricee.

A SERIES OF ARTICLES on the topography and geological formation of the various mining districts in California, by an able writer, will be commenced with our new volume.

CALIFORNIA VIEWS.—We shall give in our next volume an unusual number of fine engravinge illustrating views on this Coast, as well ae mining illustrations.

HOW THE PRESS SUFFERED.—Twenty-nine newspapere, magazines, etc., were entirely destroyed by fire or fared little better in hasty removals during the late fire iu Boeton.

THERE are 6,000,000 real-eetate owners in the United States, the farmers being 4,000,000 of the number.

A Word For Ourselves—1872.

We have had occasion to speak truthfully and favorably of many enterprises, during the twalve months past, and now we propose to do the same for our own.

During 1872 we have publisbed far more reading matter than was ever before issued in our own or any other mining journal in America. It has been prepared with much care and expense, and arranged with a view to suit the convenience of our patrons, that they might receive as mnch reliable information as possible with the best economy of time in digesting the weekly contents of our sheet.

Since 1871 we have reduced the size of our reading type throughout. Over 250 columns of MINING SUMMARY have been given during the year, containing thousands of items on the progress of mining on this coast.

Our STOCK REPORTS have been remodeled in form, and extended in space. As a weekly report of the S. F. Stock Market, it is superior. A list of assessments, sales, meetings, latest dividends, etc.; table of weekly sales and comparisons give the reader, at a glance, much valuable information, which requires days of expert figuring to furnish.

The MINING ILLUSTRATIONS in the PRESS of the past six months, embrace a number of unusual size and cost; we think they have been received with interest, and shall endeavor to produce a still greater variety of ortginal drawings.

The year 1872 has passed out of a serics of dull seasons into more PROSPEROUS TIMES for both mining and mechanical industries. On this coast it seems as if these two branches, especially, must go hand in hand, and we have continued to advocate their growth side by side.

Our aim has been to give a VARIETY OF INFORMATION, so that each in his favorite department would find articles—perhaps not obtainable elsewhere—of such special value as to yield a rich satisfaction, although a portion of the sheet should seem unimportant. We give to miners in every department a representation they would not otherwise have. Scientific knowledge, and information imparted to miners through the reported experience of others, forms the most pecuniarly profitable rcading that is within the reach of any public print to issue.

No one can look at the voluminous index which we give in the present issue, and which covers only half of the year, without a feeling of surprise at the amount of work which it indicatcs. We doubt whether any publication of the kind can be found in the world, which refers to so many subjects of interest and value within the space of six months. The subjects treated upon have all been carefully considered, and condensed, even to the shortest items, and as a general thing the matter is of such a character as will well repay a reperusal. For this reason subscribers should preserve and file their papers for future reference. Even if not bound they can be stitched together quarterly, and be made most valuable books for reference.

The paper has gained many assisting friends and patrons within the year. Our corps are strengthened in wisdom and experience, and the publishers are ready to incur even greater expense for the futura in making the MINING AND SCIENTIFIC PRESS still more replete in all its departments.

We have given our readers the best paper, ink and press work of any wldely circulated newspaper on this coast. But we are not satisfied with that. We want to serve our readers better. In order to do so, we have ordered

A New Press

Of the latest and most improved pattern for fine and fast newspaper work. It is provided with an extra complement of distributing rollers to enable us to use stronger lnk, especially for working engravings up to the best advantage. It is now on its way from Chicago, and will doubtless soon be in running order, adjoining our composing and editorial rooms, at 414 Olay street.

This number closes our twenty-fifth volnme. We could probably spare many of our readers, but we need them all. We wish to spare none. No other journal on this coast—nay, in the world—can show so large a list of subscribers of so hlgh an averege of intelligence and industrial worth.

We invite everyone whose subscription has expired to renew without delay. Perhaps at no other time will your patronage be so essential to us. Our thanks and falthful services will be guaranteed.

But we know that some will drift from us. Perhaps a few by reason of circumstances beyond their control. But hope that fortnne may yet smile liberally upon them all. Our good wishes shall follow them. We trust many will return.

While, naturally, less might be expected of a journal on this sparsely and newly populated coast, than from those of older established communities, we strive, as true pioneers, to lead the van by producing a sheet of superior practical value in the special field of journalism in which we labor.

A Mining Retrospect.

As the old year ie about drawing to a cloee, we fancy that it would not be inappropriate to oaet a retroepective glance over our mining affaire for the past twelve monthe, and see how far we have been succeseful or otherwise in thie most importaut branch of our Pacific Coast Commerce.

We boaet—and probably we are justified in doing so — of possessing the finest gold and eilver mines in the world, ecattered at short intervals from Britieh Columbia to Mexico, and from the Rocky Mountains to the Pacific Ocean —an area almost equal in extent to the whole of Enrope.

Millions of dollars have been expended in this territory, in opening up mines, constructing roads, and in the erection of magnificent quartz-mills; all of which are so many monnments to American enterprise and ekill. The question now arieee, hae all thie money been jndiciously and honestly expended, for legitimate mining purposee, or has it eometimes been purposely squandered or misapplied by dishonest and unscrupulous mining speculatore, whose sole aim is to enrich themselves at the expense of the uninitiated, who are often induced to embark in the most hopeless speculations on the strength of the fraudulent mierepresentations of this claee of men? The question is eoon answered, if we carefully examine the etatistice of Washoe, Pioche, Enreka, or in fact any of our great mining districts.

In spite of all our flattering reports of big yields we find only one mine, the "Raymond & Ely" paying a dividend, and nearly all the others levying assessments. Shonld a stranger aek the queetion, why such a mine—say, for example, Crown Point or Belcher, either of which is yielding about 300 tons a day, and making a clear profit of from $10,000 to $50,000 a week,—cannot afford to divide a little of this surplus cash among the stockholders, he would probably be told, that the Directors of the Company wanted to keep the etock down; they had sold at high figures, and then had suspended dividende in order to break the market, so they could buy back cheap, and the chances are that if thie informant was convereant with the ways of the California-street mining rings, he would consider this perfectly legitimate, and make all he could out of hie information; aud his friend would come to the conclusion that the mining interest of this Coaet wae a delusion and a snare, and controlled by a class of eharpers, in whoee hands no honest man's money was safe.

If we turn from Virginia shall we find thinge better in Eureka? Alas! there also do we find a repetition of the same old story:—the old Comstock crowd repeating their old tricke. The "Eureka Consolidated," the great mine of that district,—yielding about 500 tone of splendid ore a day—hae not paid a dividend for the last 15 months. We fancy that the Directore of this Company would be eorely pnzzled to render an account of the diepoeition made of the enormous amount of money that must have been extracted from over 40,000 tons of ore. It could not all have been spent in developing the "K. K." mine, the private property of eome of these gentlemen. But it is hard to please everybody. Some people complain when ground or rock ie ealted to pay a dividend, and others when all the salt is extracted.

In Pioche the "Raymond & Ely" pays ite regular dividends. It is not a better mine than many others, which are levying aeeessments, but then it is controlled, we are informed, "by two or three honest men." Surely theee men have misteken their vocation; what businese bave they among the stock sharps of California etreet? Sell out at once, gentlemen; let ue have an asseesment on your claim, so that it shall no longer be a reproach to all the other mines on the Coast.

There is but little room for congratulation after a careful etudy of the laet year'e mining returne. We have passed throngh a ehort period of excitement, when pricee of mining etocks reached almost fabulous figuree, followed, ae soon ae the stock bubble hurst, hy a corresponding depression, which continuee up to the preeent time. Then we put our trust in diamonds, religionely vowing never to tonch miningstock. Alas! there was Arnold and Slack, that we know of and Jonee and Smith whom we suspect, and if we wanted diamonde we found we should have to do ae they did; viz:—go to London and huy them.

But these things tell fearfully in the long run against the welfaie of the country at large. All confidence in the integrity of our miniug men, and their mode of doing businees, cannot bc destroyed with impunity. The injury tbey work others must, at eome time, recoil on their own heads. These men are ehrewd enongh to see tbat, but possibly eacb one thinks that he can save himself at the last moment. "After me the Deluge" eaid Lonie XV.

However, majorities mnst rule, and whether it may be possible to protect the rights of the minority or not, by legislation, is a subject we will discnss at a future time.

Importance of the Coast Survey

The importance of the U. S. Coast Survey can scarcely be estimated in dollars and cente. which has already been expended on this Notwithstanding tbe large amonnt of money enterprise the work has in reality but jnst been commenced, and can bardly be completed with the desired thorougbness short of a centnry hence. The entire country, from center to circonmference, ie interested in the prompt and successful prosecution of thie work.

The eafety of more than two thonsand millions of dollare in annual commercial valnes depends upon the amplitude and correctness of this work—valnee which enter more or leee into the consnmption of every family in the Union. The value of every ehip and cargo that is lost by reason of imperfect or incomplete surveye ie assessed upon the people who consume tbe merchandise which they transport. If the Coast Surveys were complete euch disastroue wrecke ae have so often occnr-ed on this Coast, without stress of weather, could scarcely take place.

It ie to be regretted that the distingnished head of the Survey, Prof. Pierce, should have found it neceesary, at a late ecientific meeting, to have made any remarks discouraging a more energetic prosecution of the Pacific Coast Survey. The needs of commerce here, be thought were not so nrgent as to call for any increased outlay. We fear that distinguished gentleman has not thoroughly stndied the late rapidly increased percentsge of commercial growth centering at this port, or taken in mind the fact that it promises to increase at even a more rapid ratio during the balance of the present decade. Before the work needed here can be apprximately finished, the tonnage entering and departing from this port will have reached an enormous value, the safety of which ought not to be jeopardized for the paltry conaideration of a few tbousand dollars per annum to increaee the efficiency of our local survey.

In this connection it may not be ont of place to call attention to the tbreatened invaeion of our harbor hy the nndue extension of wharves. It is to be regretted that in almost every large port there are to be fonnd capitaliste ever ready to push out wharves to secure individual advantage at the risk of working serione detriment to harbore. The Coast Survey ehould ever be ready to raiee a warning voice againet euch encroschments. In the case of the harbor of San Francisco, we believe that the vigilant and eminently competent officer in charge here, Prof. Davidson, hae not heen unmindful of hie responeihility in thie psrticular, although such mattere may not come etrictly within the limite of hie official dnty. He has already, in connection with other Federal officere, entered a protest againet any invaeion of this kind, which a portion of our delegation in Congress seema disposed to approve and legalize. We trust that better councils will eventually prevail, and that the harbor of San Francisco will be kept intact and unharmed, as it ehould be in view of the magnificeut future which awaits it, if so preserved.

GOOD POLICY.—The Pacific railroad employees are instructed to allow free rides to Indians on freight traine near their homes—this privileage being granted to secure their good will. This ie good policy. The Indians consider themselves the only persons entitled to "deadhead" ridee, and keep a sharp watch for white men who may be trying to evade the payment of fare. They will not be inclined to tamper with, or in any way injure a road where they have the priviledge of free rides at their pleasure.

IMPORTANT MINING SALE.—The Patterson, or as it is eometimee called the Tri Color Mine, at Tattletown, Tuolumne county, wae sold on the 19th inst., to J. J. Corrigan of thie city, for $30,000. This is an old mine which has been worked more or less since 1857. The vein is a large one and well defined. Two tunnels will be opened for the more convenient working of the mine, and a mill will be immediately erected. Two or three months will elapee before the new proprietor commences taking out ore.

California Poppy.—(*Eschscholtzia Californica.*)

Of the many beautiful native flowers that adorn the plains of California, there is none more brilliant and showy, and no more general favorite than the California poppy. It grows in the greatest profusion. In portions of the San Joaquin Valley, during the month of April, its rich blooms cover the ground so densely as to form a continuous carpet over acres of land, intermingled with various white, yellow, blue, pink and purple flowers, and under the mid-day sun, its brilliant orange color actually dazzles the eye.

This is particularly true of a species of our poppy which is frequently called the Orange Flower, on account of its rich saffron color. For we must remember that there are no less than five different kinds of this member of the poppy family in California, all of which are found in San Joaquin Valley. Of these the flowers of three are yellow; one, a deep orange or saffron; and the fifth, a pure white.

We have promised that in describing our wild flowers we shall give not only their common names, but also their botanical or systematic ones. The latter are so called because they reduce botany, or the study of plants, to a system, and science means nothing more than knowledge reduced to a system.

The systematic name of our poppy is *Eschscholtzia*. "Whew!" you will say, "what an outlandish, unpronounceable name. Why do naturalists, who ought to be men of sense, give such names to plants and animals?" We shall try to explain. Men wish to know how many kinds of animals and plants there are in the world, and to arrange and name them in order properly, according to their different kinds, to do this, leading naturalists, like Linnæus, Cuvier, and their successors, have found it necessary to give names in that language which is most generally understood throughout the civilized world by those who have enjoyed the advantages of education. That language is Latin which was spoken by the old Romans who, as you know, once ruled the world, so that their language has become a part of the many languages of all civilized nations of modern times.

These are the reasons why every animal and plant that is known has a Latin name. Sometimes these names are given from the qualities of the plant or animal, sometimes from the name of their discoverer.

In this way our California poppy is named after the man who first made it known to the scientific world.

It was named in honor of a Russian naturalist, who made a voyage around the world, and visited California nearly fifty years ago, with the celebrated Kotzebue, the Russian navigator. This was Dr. Eschscholtz, and as he first made the plant known to the naturalists of Europe, it was called Eschscholtzia, which simply means Dr. Eschscholtz's plant. It is pronounced as if spelled Es-koltz-e-a accented on second syllable. But as there are several kinds of this plant, which differ in size and color, another Latin word is added to distinguish them.

The kind which was first discovered was called *Eschscholtzia Californica*, that is, California poppy. It is the largest kind, sometimes attaining a hight of between two and three feet, and has yellow flowers. One variety of this species has pure white flowers, and may be called *Eschscholtzia Californica corolla-alba*, which being interpreted merely means the white flowered California poppy.

The orange colored species, which is most common on our lighter soils, is named *Eschscholtzia crocea*, or crocus poppy, so called because its flower is cup-shaped, and of a deep orange color like the crocus. It usually grows from a foot to eighteen inches high.

Two smaller kinds with yellow flowers are *E. compacta*, so named from its dwarfish, compact form, and *E. tenuifolia*, or slender-leaved poppy.

These poppies can be easily distinguished from our wild tulips, already described in the Press. Poppies have four flower leaves, or petals, but tulips only three. Poppies have finely divided leaves, as represented in our engraving, while tulips have simple grass-like leaves. They have but a slight odor, reminding one of a freshly cut watermelon.

Our engraver presents us to-day with a life-like, or an accurate, representation of the California poppy, giving its stem, leaves, buds, flower and seed-pod in their natural size. It is seen that the seed-pod is very differently shaped from that of the opium poppy and its kindred species.

Fig. 2 is the pod opened, when green; 3 is the same as it opens, when dry; 4 is the upper part of the seed pod, before opening; 5 is a seed magnified; 6 is a section of the same showing the germ, and 7 is the germ magnified still more.

No. 8 shows how the stamens, or male organs of the flower, are attached to the petals, and 9 is a section of an unripe seed-pod.

From March until September our poppies are blooming and beautifying the plains in some portion of California. In San Joaquin Valley they first bloom in March, are in all their glory in April, and disappear entirely by the first of July, when our plains are dry and sere. But the traveler sees them in full bloom along the Central Pacific Railroad, in Livermore Valley and to the westward, until late in September.

RALPH RAMBLER.

THE CALIFORNIA POPPY.

COMPARATIVE VALUE OF CALIFORNIA COALS.—The following table of the comparative value of California coals determined by a series of careful experiments made by the United States Government at Mare Island should be carefully studied and understood. The experiments were made with reference to determining the amount of the several kinds of coal which would be required for a calorific equivalent to a cord of the best oak wood, obtained in this market. The result was as follows:

	Pounds.
Nanaimo, Vancouver Island, B. C.	1,800
Bellingham Bay, Washington Territory	2,200
Seattle, Washington Territory	2,400
Rocky Mountain, Utah	2,500
Mt. Diablo, California	2,600
Coos Bay, Oregon	2,600

LOOKING AFTER THE WASTE ROCK.—It appears from the Territorial *Enterprise* that more attention is being given to looking after the waste rock at the various mines along the Comstock range. Numbers of laborers are engaged at the present time in sorting over the waste rock from the Bowers, Imperial, Confidence, and Bacon mines. It is claimed that the improvements which have been introduced in machinery since this rock was thrown aside, make that valuable now, which formerly could not be worked at a profit.

Experiments in Fuel—Cheap Irrigation.

Mr. Wilcox has recently been experimenting at his works on Fremont street, with his large pump or "lifter," to ascertain the relative value of coal and wood for making steam, and also the actual cost of raising given quantities of water for irrigating purposes. The boiler used was one of his style of upright tubular boilers encased with brick, the shell being 8 feet in length and 36 inches in diameter, with 36 tubes 2¼ in diameter amounting to 365 feet of heating surface. The pump in each of the following trials was gauged to run at 8 strokes per minute raising 150 gallons per stroke. The water was raised 35 feet; 14 feet of which was done by the exhaust steam alone.

The first trial was with ¼ ton of first-class quality of Mt. Diablo screenings, which ran 90 minutes, raising 108,000 gallons.

The 2d trial was with ¼ ton of ordinary Mt. Diablo coal, which ran 85 minutes, raising 102,000 gallons.

The 3d trial was with ¼ cord of dry Oregon pine wood, which ran 95 minutes, raising 114,000 gallons.

At the above rates 1 ton of good screenings, costing $7.00 per ton, will raise 432,000 gallons 35 feet, equal to 1⅔ cents for each 1,000 gallons. From the trial of wood we may reckon that one cord, at say $8.00 per cord, will raise 456,000 gallons 35 feet high, at the rate of 1¾ cents for each 1,000 gallons. Reckoning wood at $5 per cord, each 1,000 gallons will cost 1 cent and 1 mill.

Twenty-seven thousand gallons of water will cover one acre of land one inch deep, which at the rate of $5 per cord for wood will cost:

1 acre, 1 in. deep	$ 0.29⅔	1 acre, 2 in. deep	$ 0.59⅓
5 " " "	1.48⅓	5 " " "	2.98—
10 " " "	2.97—	10 " " "	5.94—
100 " " "	29.70—	100 " " "	59 40—

These lifters are made of some twenty different sizes—five of which, with their capacities and cost are given as follows:

A lifter with boiler, pipes and everything complete, with a capacity for raising 10,000 gallons per hour, will cost $628. This machine, according to the above experiments, can be run 6 days of 10 hours each with 1½ cords of wood, which at $5 per cord will cost $7.50. During those six days the machine will raise 600,000 gallons of water 35 feet above its natural level, or sufficient to flood 11 acres of land 2 inches deep. A machine of 20,000 gallons per hour capacity, costing $980; one of 40,000 gallons capacity will cost $1,720.

This machine may also be economically employed for draining mines, especially placer mines, where it is not required to raise the water to any considerable hight.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Dec. 24th, 1872.

FOR WEEK ENDING DECEMBER 10TH, 1872.

REGISTERED PACKAGE ENVELOPE.—William F. McCrary, Baker Co., Oregon.

NUT LOCK.—Francis A. Bishop, Shingle Springs, Cal.

DISH WASHER.—Augustus W. Thornton, Mendocino, Cal.

APPARATUS FOR COMPACTING GUANULAR SUGAR INTO BLOCKS.—August F. W. Partz, Oakland, Cal.

MANUFACTURE OF ARTIFICIAL STONE.—Ernest L. Ransome, S. F., Cal.

MODE OF PROPELLING CANAL BOATS.—Patrick Rippingham, Virginia City, Nev.
[This patent was issued Dec. 10, 1872.]

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Books.

HOBB'S ARCHITECTURE.—There is certainly no excuse for ugly features in architecture in this country, if the publication of books of designs, ground plans, etc, will prevent the erection of such unseemly structures. The work before us is one of this description, and a really valuable one—indeed, it is quite in advance of most which have preceded it. It contains nearly one hundred ground plans and designs, most of which are somewhat costly but many of which are well adapted to persons of moderate means.

Madame De Stael defines architecture as "frozen music;" another writer styles it "crystallized sentiment." The outlines of a beautiful building are like "a joy forever." The individual who has no eye or taste for the appreciation of beautiful forms in architecture, is incapable of one of the highest types of enjoyment to which the human mind can attain. Such a person is to be pitied. All have not the means to create such sources of enjoyment for themselves; but even a peasant may look upon a queen. So may the poorest in the community have real joy in admiring the creations of those whom fortune has blessed with means and the inclination to provide such enjoyments.

The intent of the work before us is to create a love for choice architecture, and to assist those who may be about to build, and have means to indulge more or less in taste, to so expend their money that it shall be a perpetual joy as well as comfort and necessity. In looking over its pages the reader can scarcely fail to find some plan which will serve to convey an idea of what he wants. J. B. Lippincott, Philadelphia, publisher. For sale by A. Roman & Co., of this city.

UNITED STATES CONSTITUTION.—We have before us "A Concordance of the Constitution of the United States of America, with a Compiled Index, and Questions for Educational Purposes, by Chas. W. Stearns, M. D." The Constitution of our own country is made quite too little a study in schools, and by the masses of the people. One of the chief reasons of this neglect is perhaps due to the difficulty of finding this important document printed in convenient form, with proper helps for its study. The little book before us seems to be well fitted to meet this objection, and it should hence meet with a large sale. The "questions" are so framed as to make the study both an easy and interesting one.

DOMESTIC ECONOMY

Putting up Stoves.

We have no doubt but that a great many of our readers will find their own experience reflected in the following amnsing acconnt, by an unknown anthor, of a disagreeable task to be performed, at the approach of the winter season of the year in many households:

The first step a person takes is to put on a very old and ragged coat, under the impression that, when he gets his month full of plaster, it will keep his shirt bosom clean. Next he gets his hand inside the place where the pipe ought to go, and blacks his fingers, and then he carefully makes a black mark down the side of his nose. It is impossible to make any headway in doing this work until this mark is made. Having got his face properly marked, the victim is ready to begin the ceremony. The head of the family—who is the big goose of the sacrifice—grasps one side of the bottom of the stove, and his wife and the hired girl takes hold of the other side. In this way the load is started from the woodshed toward the parlor. Going through the door, the head of the family will carefully swing his side of the stove around, and jamb his thumb nail against the doorpost. This part of the ceremony is never omitted.

Having got the stove comfortably in place, the next thing is to find the legs. Two of them are left inside the stove since the spring before; the other two must be hunted after for twenty-five minutes. They are usually found under the coal. Then the head of the family holds up one side of the stove while his wife puts two of the legs in place, and next he holds up the other side while the other two are fixed, and one of the first two falls out. By the time the stove is on its legs, he gets reckless, and takes off his old coat, regardless of his linen. He goes off for the pipe, and gets a cinder in his eye. It don't make any difference how well the pipe was put up last year, it will be found a little too short or a little too long. The head of the family jams his hat over his eyes, and, taking a pipe under each arm, goes to the tinshop to have it fixed. When he gets back, he steps upon one of the best parlor chairs to see if the pipe fits, and his wife makes him get down for fear he will scratch the varnish of the chair with the nails in his boot-heel. In getting down, he will surely step on the cat, and may thank his stars if it is not the baby. Then he gets an old chair, and climbs up to the chimney again, to find that, in cutting the pipe off, the end has been left too big for the hole in the chimney. So he goes to the woodshed, and splits up one side of the end of the pipe with an old axe, and squeezes it in his hands to make it smaller. Finally, he gets the pipe in shape, and finds that the stove does not stand true. Then himself and wife and the hired girl move the stove to the left, and the legs fall out again. The next move is to the right. More difficulty with the legs. Moved to the front a little. Elbow not even with the hole in the chimney, and he goes to the woodshed after some little blocks. While putting the blocks under the legs, the pipe comes out of the chimney. That remidied, the elbow keeps tipping over, to the great alarm of his wife. He then gets the dinner-table out, puts the old chair on it, gets his wife to hold the chair, and balances himself on it to drive some nails in the ceiling. Drops the hammer on his wife's head. At last gets the nails driven, makes a wire-swing to hold the pipe, hammers a little here, pulls a little there, takes a long breath, and announces the ceremony completed.

Job never put up any stoves. It would have ruined his reputation, if he had.

True, every word of it. We know how it is ourselves.

AMERICAN DIET.—We are a greasy people; from the pork fat of New England to the ham-fat of the South we wallow in greasy food. This becomes rancid on the stomach, and superinduces what Dr. Urquhart pronounces the sum of all diseases—dyspepsia. We drink tea that would frighten a Chinaman, and coffee that would serve as an antidote to opium. We pour down doses of alcoholic fluids which eat into the coatings of our intestines and destroy the gastric juices. We go to bed over-tasked, body and mind, sleep with sluggish blood in a state of stagnation, and get up only when the broad sun is staring in angrily at us through our bed room windows. We are reckless in our pursuit of pleasure; we strain our mental powers to their utmost tension; and end, old men and women before our time, or die, or fill a cell in an insane asylum.

HOW TO SAVE COAL IN OPEN GRATES.—The *Spectator* remarks that "the most practical suggestion yet made towards economy of coals seems to be the use of solid bottoms in ordinary fire-grates. It is asserted, and indeed proved, that in any fire-place not excessively small, a plate of iron placed upon the grate will halve the consumption of coal, reduce the smoke, and leave a cheerful, free-burning fire. Quite sufficient air enters through the bars, no poking is necessary, and the fire never goes out till the coal is consumed. There is no ash and no dust, every particle of fuel being consumed. Any householder can try this experiment, and reduce his coal bill, say, 30 per cent., at the cost of a shilling." This is not a new idea, but we believe it to be a good one.

THE ATTENTION

OF

Manufacturers, Dealers and Importers of Iron, Steel, Hardware, Railway Supplies, Lubricating Oils, White Lead, etc., etc.,

—IS INVITED TO THE—

The Largest Metal Price-Current in the World.

The Leading Journals of this country and Europe recognize it as a Representative Paper of the American Metal Trades.

The publishers have, ever since this journal was established, employed the ablest correspondents and solicitors to be procured; expending more money for their salaries alone than the entire expenses of many prominent newspaper establishments. The annual sum paid for original matter exceeds *ten thousand dollars*. It contains more manufacturing news than any other journal published in the United States, and for this feature alone is worth more than its subscription price. Illustrations of machinery and railway appliances and other new inventions, add largely to its interest and value. The circulation of THE IRON WORLD is far greater than that of any similar publication in this country.

ACCURATE QUOTATIONS & REPORTS

—OF THE—

LEADING HOME AND FOREIGN MARKETS.

THE BEST TALENT IS EMPLOYED, AND IN CONTENTS, PAPER, AND TYPOGRAPHICAL APPEARANCE, SECOND TO NONE.

Located in the very center of the metal interests of the United States, with correspondents at the leading cities of the Union, we do not err in claiming that it is the *Representative Journal* of the Metal Manufacturers, Workers, and Dealers of this country. As a journal for machinists and metal workers it has no rival, and contains every week the choicest selections from engineering, mining and scientific publications of this country and Europe. Its motto is "Progress," and it has compelled other journals of a similar character to *follow its lead*. Its readers comprise Iron and Steel Manufactnrers, Machinists, Founders, Hardware Dealers and Tinners, Gunsmiths, Plumbers, Cutlery Manufacturers, File Manufacturers, Saw Manufacturers, Boiler Manufacturers, and leading Railway Officials.

Only $4.00 per Annum.

If you are in the Metal Trade, take a Metal Paper. It will save you more than its cost. If you are a Manufacturer, take the journal that advocates your interests.

ADVERTISE.

It is universally conceded that advertising is a necessity to success in business. It is also conceded by the shrewdest business men that NEWSPAPERS are the best medium for reaching the parties whose trade is desired. THE IRON WORLD AND MANUFACTURER reaches more people engaged in the Metal Trades, than the New York *Tribune*, *Scientific American*, or any of the high-priced advertising mediums published in this country. The judicious advertiser will always seek the mediums that reach his trade; and advertising has been deemed unprofitable by many firms, who have received no adequate return, simply because they expended their money in the wrong channel. We have no hesitation in saying that our journal is the BEST medium in the United States for reaching the Metal Trade, and we will be happy at any time to furnish refereuce to leading manufacturers in this city and elsewhere, who will testify to the fact that they have received orders for goods, from parties who read their cards in *The Iron World*. In fact, many who have availed themselves of this medium, candidly say that its value exceeds that of all other journals in which they are represented.

Sample copies mailed free. Address,

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of Intermittent and Marsh Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegent appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries, No. 521 Montgomery St., between Clay and Commercial, San Francisco. no28

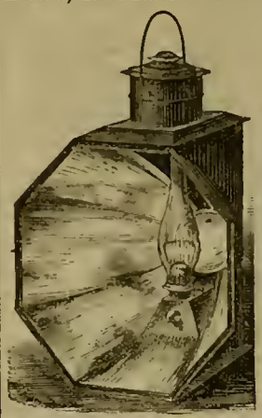
PACIFIC LAMP MANUFACTORY.
EMIL BOESCH,
Patentee and Manufacturer of
LAMPS, LANTERNS AND REFLECTORS.



The patent head light represented by the cut is the cheapest and most reliable light for railroad purposes in use. Size, as follows: 16-inch Octagon Front Glass; 20-inch Octagon Front Glass; 24-inch Octagon Front Glass.
They are especially adapted for use in hydraulic mines, tunnels, mills, wharves, etc. We also manufacture Lamps with Metallic Reflectors, Lamps with Mica Reflectors, Lamps with Mica Chimneys, Lamps with Metallic Chimneys,

Smelting Ores on the Pacific Coast. No. 1.

We are well aware of the difficnlty of speaking with any minuteness, in the space of a newspaper article, of the operations that have beeu undertaken on this Coastin this important line of business—a business, which is destined to become one of the most important and successful of our enterprises; nevertheless, we shall attempt to give, in the present article, a condensed history of smelting as it has beeu carried on, and hereafter a few hints as to the manner in which it must he conducted to make it a success.

The Reduction by Fire

Was the only method known to the ancients of obtaining metals from their ores, and was carried by them to a much greater perfection than they are generally credited with. Amalgamation of the precions metals is a comparatively modern process arising from recent improvements iu machinery, and chemical knowledge.

Till within the last few years little or no attention had been paid to smelting any kiud of the numerous ores found on this Coast, and which were properly susceptable of reduction by this most primitive, yet in many instauces, most effective process. The reasons for this are easily found in the natural features of this country, the non-discovery of any really good quality of coal for blast furnaces, and the expense nnder the most favorahle circumstances attending the manufacture of charcoal, owing to the high price of labor and transportation, were sufficient in themselves to account for the lapse of time betweeu the day mining became a bnsiness, and smelting a success on this Coast. The first furnaces worthy of mention that were erected on this Coast were in Oregon for the reduction of

Iron Ore.

The quality of iron manufactured was excellent, hut the enterprise for the time proved a financial failure, owing partly to the high price of labor and partly to the country being too youug for the business.

Railroads, those great ultilizers and developers of iron iuterests not haviug heen even projected in that day. We have not yet heard of the works being put again into operation, though douhtless they, in common with the other iron interests of this Coast have a brilliant future before them, when the price of labor and fuel shall permit competition with the iron producing regions of the world.

The first furnaces for the smelting of

Argentiferous Lead Ore,

Were erected at Oreana, Nev., in 1863, and consisted of hlast furnaces aud a cupel furnace for refiuing the bullion on the ground *i. e.*, separating the had and other base from the precious metals, the expense of transportation heing too great to ship the crude hullion. The works did not pay. The proprietors were all Eastern men, who allured by the prospect of the large profits which such an enterprise would have commanded, with eastern prices and easteru facilities, and ignorant of the difficulties and expenses of such a prospect, whon carried on with 300 miles of team transportation between the works and any outlet to civilization found themselves after large outlay with a prospect of no return.

It was one of the mauy failures that have happened when eastern capital has been invested here in enterprises, a careful iuvestigation of which would have proved their worthlessness, and even a cursory examination of then doubtful stability; and has aloug with ite fellows prevented many an iuvestment being made in mines that good seuse would have warranted, and good dividends sustained.

Lead Ores of Inyo County.

The first really successful attempt at smelting the lead ores of this Coast was made in Iuyo County in this state some four years ago. The works were under the euperintendence of Mr. Belshaw, and the ore was smelted in an upright hlast furnace after the Castiliau model.

These works, thongh separated from any convenient outlet by nearly 175 miles of land travol, have had the great advantage of heiug surronnded by mines producing the very best quality of smelting ore, containing a large proportion of lead free from most base metals, generally as high as 40 to 50 per cent. The silver contained in these ores is generally high; iu somo samples we have seen even as high as $1,500 per ton of 2,000 lbs, though this of course is decidedly exceptional. The average of the ores must be nearly $100 per tou in silver with the additional advantage of containing sufficient lead to permit the mixing in the smelt, of a small proportiou of the rich silver ore obtainable here. Some of these ores contaiu as high as $500 per tou in silver aud the additiou of a small proportion of them to rich lead ores gives the bullion a much greater proportion of silver without increasing the loss in the process by either furnaces or enriching the slags.

The ores found in this, the 'Lone Pine" District, and used in smeltiug, are chiefly galeua, though carbonates and oxides are also obtained.

The galenae (sulphurete of lead) are generally roaeted, though in some cases only a portion is roasted and the charging of the furnace so mauaged as to combine carbonates, oxides, roasted ores, and a portion of unroasted galena.

The results from these furnaces have been very generally good, so much so, that a number of other furnaces have been erected by other companies and the quantity of hullion manufactured has been so great that at times it has accumulated at the works in large quantities, the production being so much greater than the means of transportatiou at hand. These works and mines in this portion have been and now are in successful operation and bid fair to continue so with even increasiug profits for mauy years to come. In fact when the projected railroads shall reach this point, probahly within two years, the profits of the smelting works at this District must be very materially increased.

The uext to successful smelting operations we have to notice are those at

Eureka, Nevada.

The ores are very similar to those at "Loue Piue," carryiug a larger proportion of lead and silver, though perhaps as a rnle the lead is more geuerally in the carbonate and oxyde from those at "Lone Pine." The percentage of silver in the bullion produces as high in some cases, evcu as much as $500 to $600 per two thousand pounds. In fact the great amount of silver in these ores permits their successful workinq under circumstances that with those of lower grade would have proved a financial failure. Eureka is eighty miles from the railroad; charcoal is very high (30 to 35 cents per hushel, and labor is at corresponding rates; moreover the amount of wood suitable for the manufacture of the fuel is limited. Under these circumstances, it is easy to see that uone hut rich ores will pay for reduciug; in some cases furnace linings, owing to improper management of furnaces and the character of the ores redneed, have to be replaced, even after less than a month's run. The futuro of Eureka and the adjacent mining sections with regard to their lead interests are very largely dependent upon the projected narrow gauge railroad, and the recent development in the mines at this point, together with the confidence shown hy tho pnblic in the high price paid and demanded for some of the Eureka stocks, all tend to forward tho chances for the completion of this enterprise.

The Lead Mines of Utah

Were next in point of time as to discovery on this coast. They are very nnmerous and in many cases very rich as well as extensive. The lead mining districts are chiefly the Cottonwoods, American Fork and West Tintic, though Ophir, East Tintic and Bingham Cañon among their various mines have some producing fine smelting ores. The first district in which mines of this character were discovered was Little Cottonwood, which was soon prominent on account of the almost fabulous wealth of the famous Emma mine, which produced ore of sufficient richness in silver to pay a very handsome profit on its direct shipmeut to Europe. There have been so mauy fine mines discovered of argentiferous lead ore in that territory that to attempt a mention of them by name wonld be impossible iu the limits of a newspaper article. A large numher of furnaces have been erected here, some with good success, others with indiffereut results, owing to errore in their construction, or lack of uecessary facilities. There have also been attempts made in

Copper Smelting

On this coast, but owing to the falling off in the value of copper and the great amonnt of fuel necessary to prodnce the refined metal from reducing ores, and the difficulty in finding men experienced in the husiuess, they have in many cases proved financial failures. The recent great increase in the value of copper will doubtless stimulate this branch of smelting, though for the present we believe it to he the wisest plan, as a rule, to merely smelt the copper ore to a high grade of matte and ship it for complete reduction and refining to points where fuel and other facilities aro both cheaper and more convenient.

Among the prominent smelting works erected in this State were those for the reduction of copper ore at Antioch, on the San Joaquin River. They consisted of reverberating furnaces, but on account of the expeuses of good fuel, (Mount Diahlo coal being of such a nature as to soon after being heated, crumble into powder aud fall between the grate bars into the ash pits, thns wastiug a great part of its caloric), and the expeuses of a corporation being saddled on to a small number of furnaces, the works did not pay, and were discoutinued; and soon aftcr this the great decline in copper took place; they havo not heen put into operation again.

Antimony Smelting

Has been attempted in Nevada, the only place in the United Statee where antimony was ever produced directly from the ores; but owing to the falling off in the price of the metal from 22 cents to 13 cents per pound in currency, the business has been for the present abandoned, though the quality of the metal ohtained was first-class, and sold for the same price as the best English Star Regnlus. But of this branch of smelting we may speak more at length in a futuro article, and we try to give a few practical hints ou the smelting of the argentiferous lead ores of the Coast, and a statement of the difficulties to be encountered in it, as well as a view of the prospects for makiug it one of the great businesses of this section of the United States.

Leather Market Report.

[Reported for the Press by Dolliver & Co.]

SAN FRANCISCO, Thursday, Dec. 26, 1872.

Shipments of Sole Leather to the East are quite heavy, and prices are firm, though there has been no advance. Domestic Calf Skin has advanced 10 per cent., in consequence of the large amount destroyed, and French Skins are firm with an upward tendency.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other puolishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journals for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other Americau weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has uo rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Boues came from my nose; my breath became offensive; I was compelled to eat alone. I had given up all hopes of heing cured at this time. I met Dr. Every, of Chicago, who had been cured by a remdey discovered by himself. I tried the remedy, with little faith; but at the end of three months found myself cured." Our informant has now associated himself with the discoverer in the manufacture of the article, which will be known under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 60 cts. A. F. EVORY & CO., No. 9 Post street, San Francisco. 26v25-3m

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California street, San Francisco, is general agent for this Coust. Send to him for circulars and information of this reliable, first-class company.

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Piue.

New Inventions.

A GRATE BAR that don't burn out, for furnaces.

SHEARS for cutting grapes and flowers.

A new ROLLER SKATE that is superior to all others.

A DRINKING FOUNTAIN for fowls.

A superior ROAD SCRAPER.

The chcapest and best FARM FENCE ever built.

A POST DRIVER that every farmer should have.

An improvement on DENTAL PLATES to hold them firmly in the mouth.

A new FURNACE for roasting ores.

A SASH TIGHTENER that keeps out all dust, takes the place of weights, and keeps the windows from rattling.

A BEN SPRING that never gets out of order.

A machine that packs, sacks and weighs flour.

A SAND CAP that keeps all dust out of hnhs.

A POTATO DIGGER that will dig a row as fast as a man can walk.

A HOUSEHOLD TOOL that should he in every family.

A self-acting NUT ROASTER that works to perfection.

A new GAS LAMP that costs only half a cent per hour to hurn.

An improvement in THILL ATTACHMENTS.

A superior CIDER and WINE PRESS.

The best SELF-OPENING GATE ever invented.

A PLOW on a new principle—it works to perfection in adohe.

A new VEGETABLE CUTTER for house use.

An improved PLOW CLEVIS.

A simple, cheap and perfect POLISHING AND FLUTING IRON combined.

A TOY ENGINE that every boy should have for instruction.

A new GLASS CUTTER that beats a diamond.

A CAN OPENER that cuts any shaped hole and every size.

The best WASH BOILER ever invented.

An EGG BEATER—that beats eggs in one minute.

A WALL PROTECTOR for placing behind wash stands.

A new SULPHURET-SAVING MACHINE.

The LITTLE GIANT CORN SHELLER, for $1.50 by mail.

A KNIFE SHARPENER that should be in every kitchen.

A CORN HUSKER that husks 400 bushels per day.

The best machiue to CLEAN GRAIN in the world.

A new HOD CARRIER, just out.

We invite parties who feel interested in any of the above named inventions to call and examine samples or send for a descriptive circular of the article. We have also many other valuable patents on hand for negotiation.

WIESTER & CO., Patent Brokers,
17 New Montgomery street, San Francisco.

FRIEL'S PARAGON VAPOR STOVE.

PATENT APPLIED FOR.

The Great Labor Saver of the Household.

ECONOMY, CONVENIENCE AND SAFETY COMBINED.

JUST THINK OF IT—No Wood, no Coal, no Coal Gas, no Stove Pipe, no Chimney, no Smoke, no Ashes, no Dirt, no Wood Boxes, no Coal Scuttles, no Kindling Wood, hut a Friction Match, and the

Fire in Full Blast in Half a Minute!

OVEN HOT IN TWO MINUTES.

Steak broiled in seven minutes! Bakcd Beans in thirty minutes! The fire extinguished in a moment!. And the bousc unheated!

It has no rival in all kind of Cooking and Flat Iron Heating, and combines Ecouomy, Convenience, Neatness, Safety and Durability! The LADIES Welcome it; a little CHILD can operate it, and

ALL RECOMMEND IT.

Prices from $6 to $25, according to size.

Norman Gold Mining Company—Location of works, Aqueduct Mining District, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of November, 1872, an assessment of five cents per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Thursday, the 12th day of December 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 4th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal. no16

POSTPONEMENT—"NORMAN GOLD MINING COMPANY."—The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the 2d day of January, 1873, and the sale thereof until Thursday, the 23d day of January, 1873, at the same place and hour. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

San Francisco, December 12, 1872.

Old Providence Mill and Mining Company, Location of works, Hayden Hill Mining District, Lassen County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 7th day of November, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Dean, T R	4	5000	$1250
McDonald, D L	9	100	25
McDonald, D L	11	100	25
McDonald, D L	38	2500	625 00

And in accordance with law, and an order of the Board of Trustees, made on the 7th day of November, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 45 Montgomery street, San Francisco, Cal., on the 6th day of January, 1873, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

FRANK SWIFT, Secretary.

Office, No. 415 Montgomery street, San Francisco, Cal. de21-3t

Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21st day of November, A. D., 1872, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary at the office of said Company. Any stock upon which said assessment shall remain unpaid on Monday, the 30th day of December, A. D., 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 24th day of January, A. D., 1873, at the office of said Company, at the hour of 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS,
SAN FRANCISCO, November 25, 1871.

SEALED PROPOSALS FOR FURNISHING CERtain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;

Stone for Facing of Basement Story and Building the same in the Walls, etc;
Rolled Iron Joists;
Iron Girders and Columns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc;
Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposal can be had on application to the Secretary, and the Plans and Drawings can be seen, and all further information—as to the details of the work, etc.—can be obtained from the Architect, at the office of the Board.

The Bids must be endorsed for the Material proposed to be furnished or Work done, and addressed to the Secretary of the Board.

No Bids will be entertained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the due entering into the contract of the party to whom it may be awarded, or to be forfeited, if the party fail to enter into the said contract.

Each bidder for Brick will state what quantity he will furnish within one year, and at what times he will deliver them. Samples must accompany each bid.

The Board reserve the right to reject any or all bids.

Payments will be made monthly in "City Hall Warrants," of 75 per cent. of estimated amounts due, and the remaining 25 per cent. when the contract is completed.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

no30-1m

NOTICE OF POSTPONEMENT.

The time for receiving bids advertised to be received December 27th, is hereby extended to JANUARY 10th, except for Cement, which is extended to January 24, 1873.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

Betts's Capsule Patents.

To prevent infringements, notice is hereby given, that *Betts's name is on every Capsule he makes for the principal merchants in England and France,* thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it is applied.

The LORD CHANCELLOR, in his judgment, said that the capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

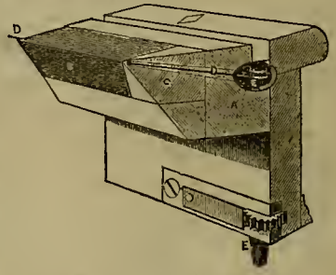
Building Fronts, Water Pipe
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

OFFICE, No. 10 BUSH STREET, San Francisco.

Sketch of Delaney's New Patent Cushion.



DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire, tending from pin into and through rubber cushion; B, rubber cushion; C, is end of rubber cushion; A, lining.

Their construction is of the simplest kind, thus making no heavy expense for suppositous elaboration. The improvement is a steel wire running lengthwise, and communicating with a pin at each end and inside of the rails; the wire is imbedded in the rubber cushion near its edge or surface. The pin mentioned is controlled and operated upon by a key, regulating the tension of the wire, according to the necessities of the case. It keeps the edge of the cushion straight and sharp. It prevents the rubber hardening from the impingement of the ball, and, above all other considerations, the angles are bound to be perfectly correct.

The ball never jumps from the table, however severe the stroke. It makes no noise when leaving the cushion.

Nine cushions are made upon our tables with the same degree of force requisite to make six upon any other.

These unrivalled cushions are self-protective, and will retain their elasticity either in hot, cold, dry, or damp weather, almost forever.

Thousands of Delaney's cushions have been introduced throughout California and the Great West, where the largest billiard manufacturers now make exclusive use of them, to the eminent satisfaction of their patrons.

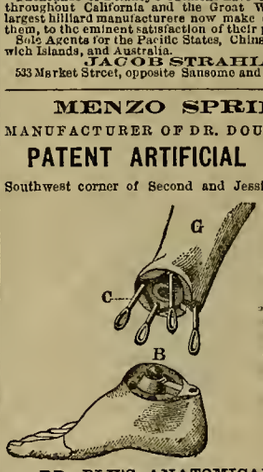
Sole Agents for the Pacific States, China, Japan, Sandwich Islands, and Australia.

JACOB STRAHLE & CO.,
533 Market Street, opposite Sansome and Sutter. 2m

MENZO SPRING,

MANUFACTURER OF DR. DOUGLAS BLY'S
PATENT ARTIFICIAL LIMBS.

Southwest corner of Second and Jessie streets, S. F.



$100 Buys the Challenge Leg, THE BEST ARTIFICIAL LEG THERE IS MADE, with one exception, and that is

DR. BLY'S ANATOMICAL LEG,
with universal ankle motion. (The accompanying cut is its illustration).

These Legs, besides being made of the best material, in the most artistic manner, are properly fitted to the wearer; and for this a practical guaranty is given. A trial, and satisfaction before pay is required.

For full price list, and descriptive circular of legs and arms, etc., call on or address

MENZO SPRING,
101 Jessie street, San Francisco, Cal.
20v4-1am-bp

WARNER & SILSBY

Manufacture all sizes of
Bed and Sofa Springs,
Which they offer to the trade at reduced prices; also the celebrated Obermann Self-Fastening Bed Spring.

Any man can make his own Spring Bed with them by attaching them to the slats of any bedstead.

No. 147 New Montgomery Street, corner of Natoma, San Francisco. 23v3-6m

Machinists and Foundries.

ESTABLISHED 1851.

PACIFIC IRON WORKS,

First and Fremont streets,

SAN FRANCISCO

IRA P. RANKIN, A. P. BRAYTON,
GEO. W. FOGG, Superintendent.

Steam Engines and Boilers,

MARINE AND STATIONARY,

IRON AND BRASS CASTINGS

Mining Machinery of Every Description,

And all other classes of work generally done at first-class establishments, manufactured by us at the lowest prices, and of the best quality.
☞ Particular attention paid to Jobbing Work and Repairs.
N. B.—Sole Agents for sale of HUNTOON'S CELEBRATED PATENT GOVERNOR.
18v20-3m GODDARD & CO.

FULTON
Foundry and Iron Works.

HINCKLEY & CO.,
MANUFACTURERS OF
STEAM ENGINES,
Quartz, Flour and Saw Mills,
Hayes' Improved Steam Pump, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery.
N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-qy

GEORGE T. PRACY,
MACHINE WORKS,

109 and 111 Mission Street,
SAN FRANCISCO.

These Works have lately been increased, by additional Tools, and we are now able to turn out any kind of work, equal to and cheaper than any establishment in the State; that is to say:—

STEAM ENGINES,
Flour and Saw Mills,
QUARTZ MACHINERY
Printing Presses,
AND MACHINERY MADE OF EVERY DESCRIPTION.

Improved Safety Store Hoists,

Fitted with Cutting's Patent Cams, unequaled for safety, convenience and cheapness. This Hoist can be built for about half the price of any other in use. To be seen at HAWLEY & CO.'S.

ALSO, MANUFACTURER AND SOLE AGENT FOR
Pracy's Celebrated Governor.
TURNING LATHES, Etc., constantly on hand.
4v23tf

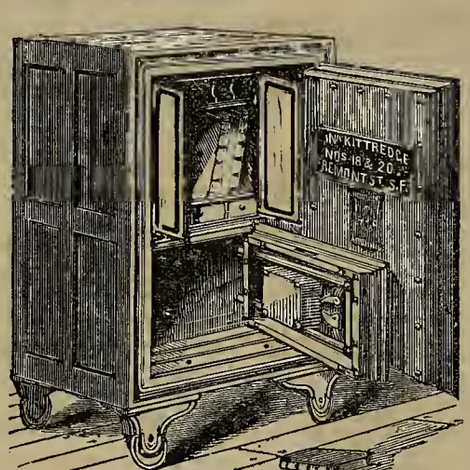
UNION IRON WORKS,
Sacramento.

ROOT, NEILSON & CO.,
MANUFACTURERS OF
STEAM ENGINES, BOILERS,
CROSS' PATENT BOILER FEEDER AND SEDIMENT COLLECTOR
Dunbar's Patent Self-Adjusting Steam Piston
PACKING, for new and old Cylinders.
And all kinds of Mining Machinery.
Front Street, between N and O streets,
SACRAMENTO CITY.

PACIFIC
Rolling Mill Company,

SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
— AND —
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
— ALSO —
HAMMERED IRON
Of every description and size.
☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention
☞ The highest price paid for Scrap Iron. 9v143

PHŒNIX IRON WORKS.



MANUFACTORY OF

Iron Doors and Shutters,
Wrought Iron Girders,
Prison Cells,
Bank Vaults, and
Bank Locks.

A LARGE ASSORTMENT OF SAFES OF ALL KINDS CONSTANTLY ON HAND.

ALL KINDS OF HOUSE SMITH WORK, FIRE-PROOF SAFES, MONITOR SAFES, FIRE AND BURGLAR-PROOF SAFES.

JONATHAN KITTREDGE,
Nos. 18 and 20 Fremont Street, Near Market, SAN FRANCISCO.
Send for Descriptive Circulars and Price List. 7v4-1am6mhp

H. J. BOOTH & CO.,
UNION IRON WORKS,

(The Oldest and most Extensive Foundry on the Pacific Coast).
Cor. First and Mission Sts.,
SAN FRANCISCO.

Marine, Locomotive and Stationary Engines Quartz Crushing and Amalgamating Machines, Mill Irons and Brass and Iron Castings, of every description, made to order.

Steamboat Repairing, Boilsr Making, Turning and Finishing,
EXECUTED WITH DISPATCH.

Beet Sugar Machinery complete in every part—made specialty.

OIL MACHINERY.

A complete set of Machinery of our own design and patent for extracting oil from Castor Bean, dispensing with Hair Cloth. Also Machinery for Flax Seed Oil, Mustard Seed Oil, and Sun Flower Seed Oil.

MARBLE MACHINERY

For sawing Marble of any thickness or size.

Irrigating Pumps. Steam Pumps.

Plans, Estimates, and Advice promptly supplied.
H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT
4v24-1y5lamr

GEO. W. PRESCOTT. O. W. SCHEIDEL. W. R. ECKART

PRESCOTT, SCHEIDELL & CO.,
MARYSVILLE FOUNDRY.

Corner of B and Fourth streets, Marysville, Cal.

MANUFACTURERS OF
STEAM ENGINES,
STATIONARY AND PORTABLE
SAW AND GRIST MILLS,
Hydraulic Machinery,
Quartz Crushing and Amalgamating Machinery

Of every description, constantly on hand.

Plans and estimates furnished upon application. Repairs upon all kinds of Machinery promptly made, and at moderate charges.
Having unrivalled facilities, we are prepared to make to order, at short notice, anything required in our line.
Specimens of our work may be seen in all the mining regions on this coast.

NOTICE.

THE PROPRIETORS OF THE

VULCAN IRON WORKS

HAVING RECENTLY REFITTED THEIR Shops with New Tools of late and modern improvemente, have facilities unequalled by any establishment in San Francisco, for turning out with dispatch all classes of machinery used on the Pacific Coast.

The variety and completenees of our Patterne enable us to supply the general wants of the Pacific States and Territoriee at the lowest poseible rates.

Office—135 and 137 Fremont St.,
BETWEEN HOWARD AND MISSION, S. F.

ARNOT, BIRCH & CO.,
Proprietors.
WM. H. BIRCH, Superintendent.
N. D. ARNOT, Manager.
12v25-tf

CALIFORNIA BRASS FOUNDRY,

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.
☞ PRICES MODERATE. ☜
J. H. WEED. V. KINGWELL.

OCCIDENTAL FOUNDRY,

137 and 139 First st., near the Gas Works, San Francisco.

STEIGER & BOLAND,
IRON FOUNDERS.

IRON CASTINGS of all descriptions at short notice
All orders punctually executed in time agreed on
Particular attention paid to making superior Shoes and Dies. Among the special castings of this Foundry are the well known CALLAHAN GRATE BAR, of superior merit for burning screenings—all size Bars. STRATTON'S JACK SCREWS, all sizes. Superior, compact and effective Horse Powers, Pumps, Agricultural Castings, Ingot Moulds, Assaying and Refining Retorts and Kettles, and a great variety of other and special castings.

STEIGER & BOLAND Proprietors.

Steiger & Boland are the sole Manufacturers of the Improved Hepburn Roller Pan. The patterns having all the Improvements to those Pans, are at the Occidental Foundry, enabling the Establishment to deliver all pans and parts thereof with uniformity, finished in the best style, and at the lowest possible price. Pan Castings furnished the trade, with liberal facilities for erection, &c. All persons are cautioned against making, selling or using these Pans, except through the authorized agents and manufacturers, viz., Steiger & Boland, of the Occidental Foundry, S. F.

22v25-3m WM. H. HEPBURN.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

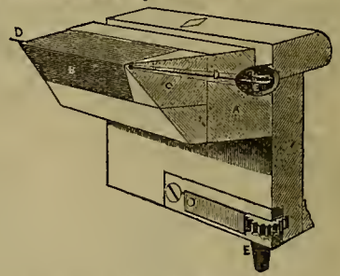
Building Fronts, Water Pipe
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

OFFICE, No. 10 BUSH STREET, San Francisco.

Sketch of Delaney's New Patent Cushion.



DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire, tending from pin into and through rubber cushion; B, rubber cushion; C, is end of rubber cushion; A, lining.

Their construction is of the simplest kind, thus making no heavy expense for suppositous elaboration. The improvement is a steel wire running lengthwise, and communicating with a pin at each end and inside of the rails; the wire is imbedded in the rubber cushion, near its edge or surface. The pin mentioned is controlled and operated upon by a key, regulating the tension of the wire, according to the necessities of the case. It keeps the edge of the cushion straight and sharp. It prevents the rubber hardening from the impingement of the ball; and, above all other considerations, the angles are bound to be perfectly correct.

The ball never jumps from the table, however severe the stroke. It makes no noise when leaving the cushion.

Nine cushions are made upon our tables with the same degree of force requisite to make six upon any other.

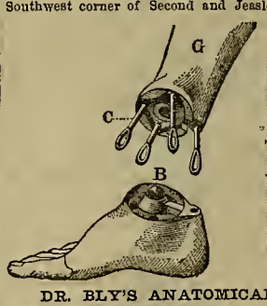
These unrivalled cushions are self-protective, and will retain their elasticity either in hot, cold, dry, or damp weather, almost forever.

Thousands of Delaney's cushions have been introduced throughout California and the Great West, where the largest billiard manufacturers now make exclusive use of them, to the eminent satisfaction of their patrons.

Sole Agents for the Pacific States, China, Japan, Sandwich Islands, and Australia.

JACOB STRAHLE & CO.,
533 Market Street, opposite Sansome and Sutter. 2m

MENZO SPRING,
MANUFACTURER OF DR. DOUGLAS BLY'S
PATENT ARTIFICIAL LIMBS.
Southwest corner of Second and Jessie streets, S. F.



$100 Buys the Challenge Leg, THE BEST ARTIFICIAL LEG THERE IS MADE, with one exception, and that is

DR. BLY'S ANATOMICAL LEG,
with universal ankle motion. (The accompanying cut is its illustration).
